## The CLIVAR/CO<sub>2</sub> Repeat Hydrography Program

by

Richard A. Feely, NOAA/PMEL, Seattle, WA USA

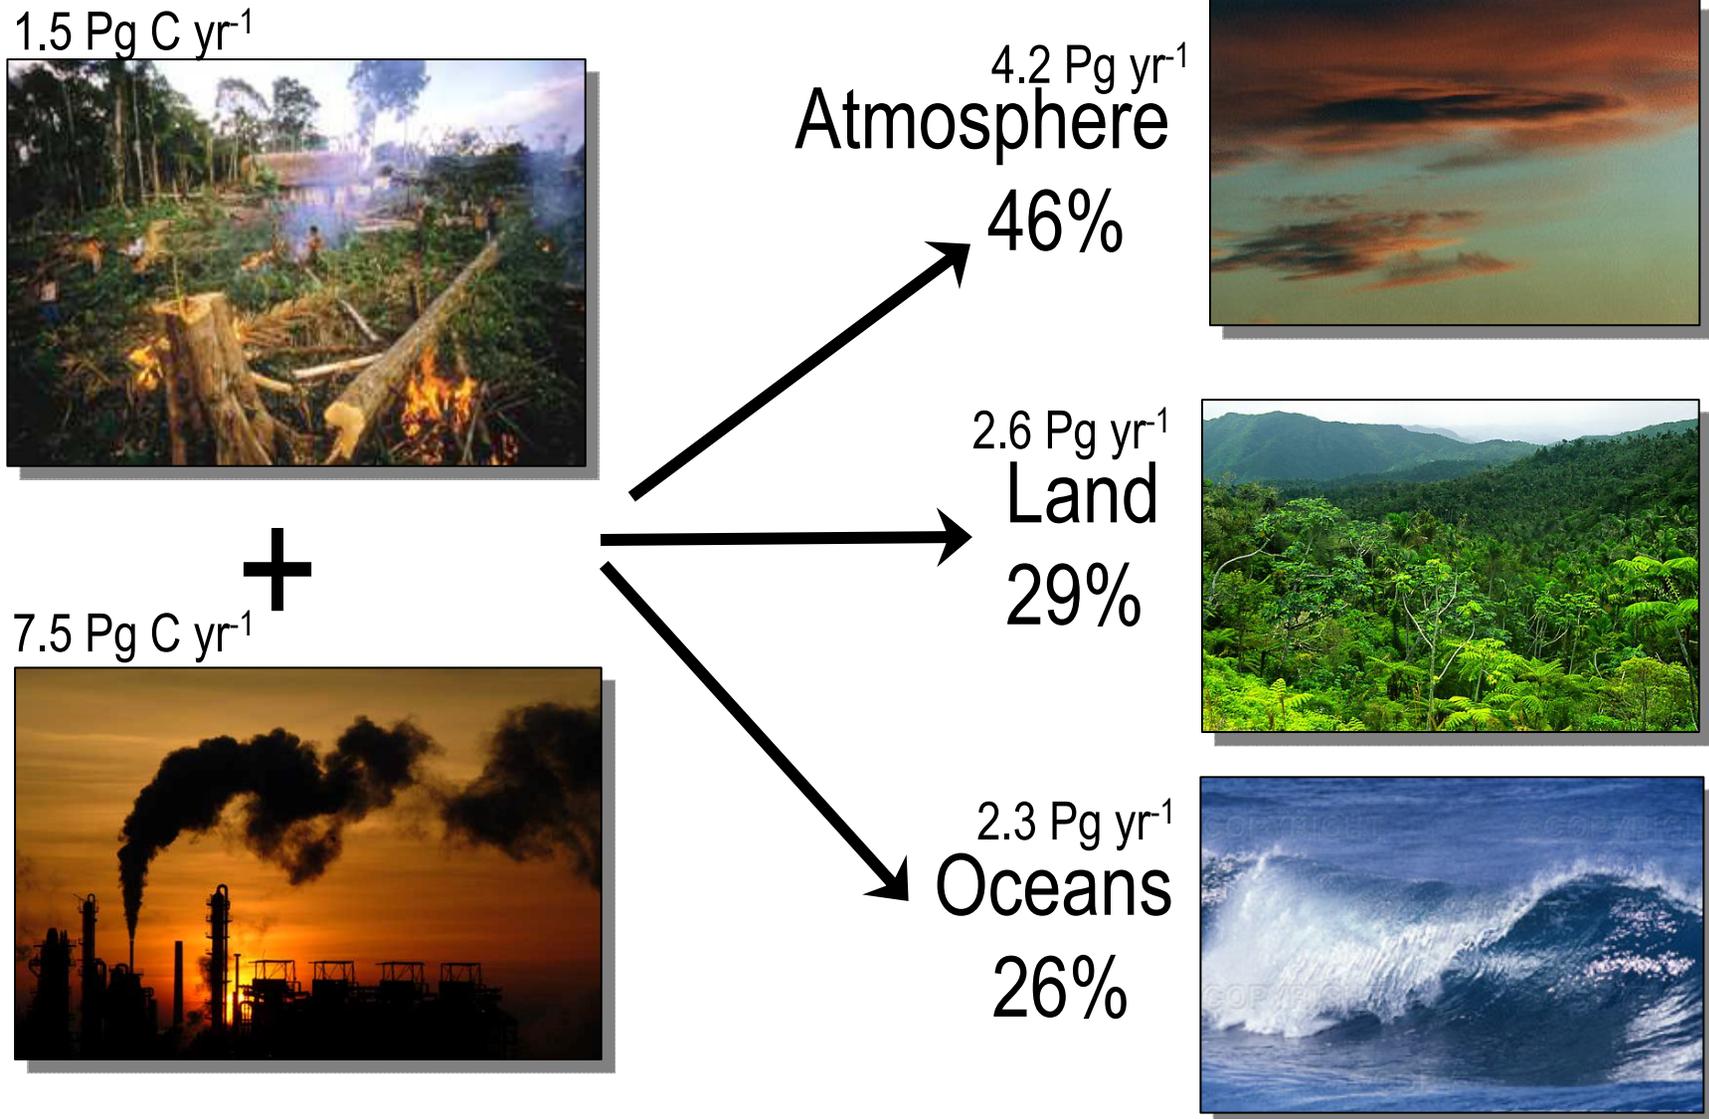

Acknowledgements: Christopher L. Sabine (PMEL), Frank Millero (RSMAS), Andrew Dickson (SIO), Rik Wanninkhof (RSMAS), Toste Tanhua (IFM-geomar), Taro Takahashi (LDEO), Niki Gruber (ETH Zürich)

# Outline of the Talk

1. Review history of carbon storage estimates using ocean interior measurements.
2. Summarize the current state of decadal change estimates (based on observations).
3. Where do we go from here.

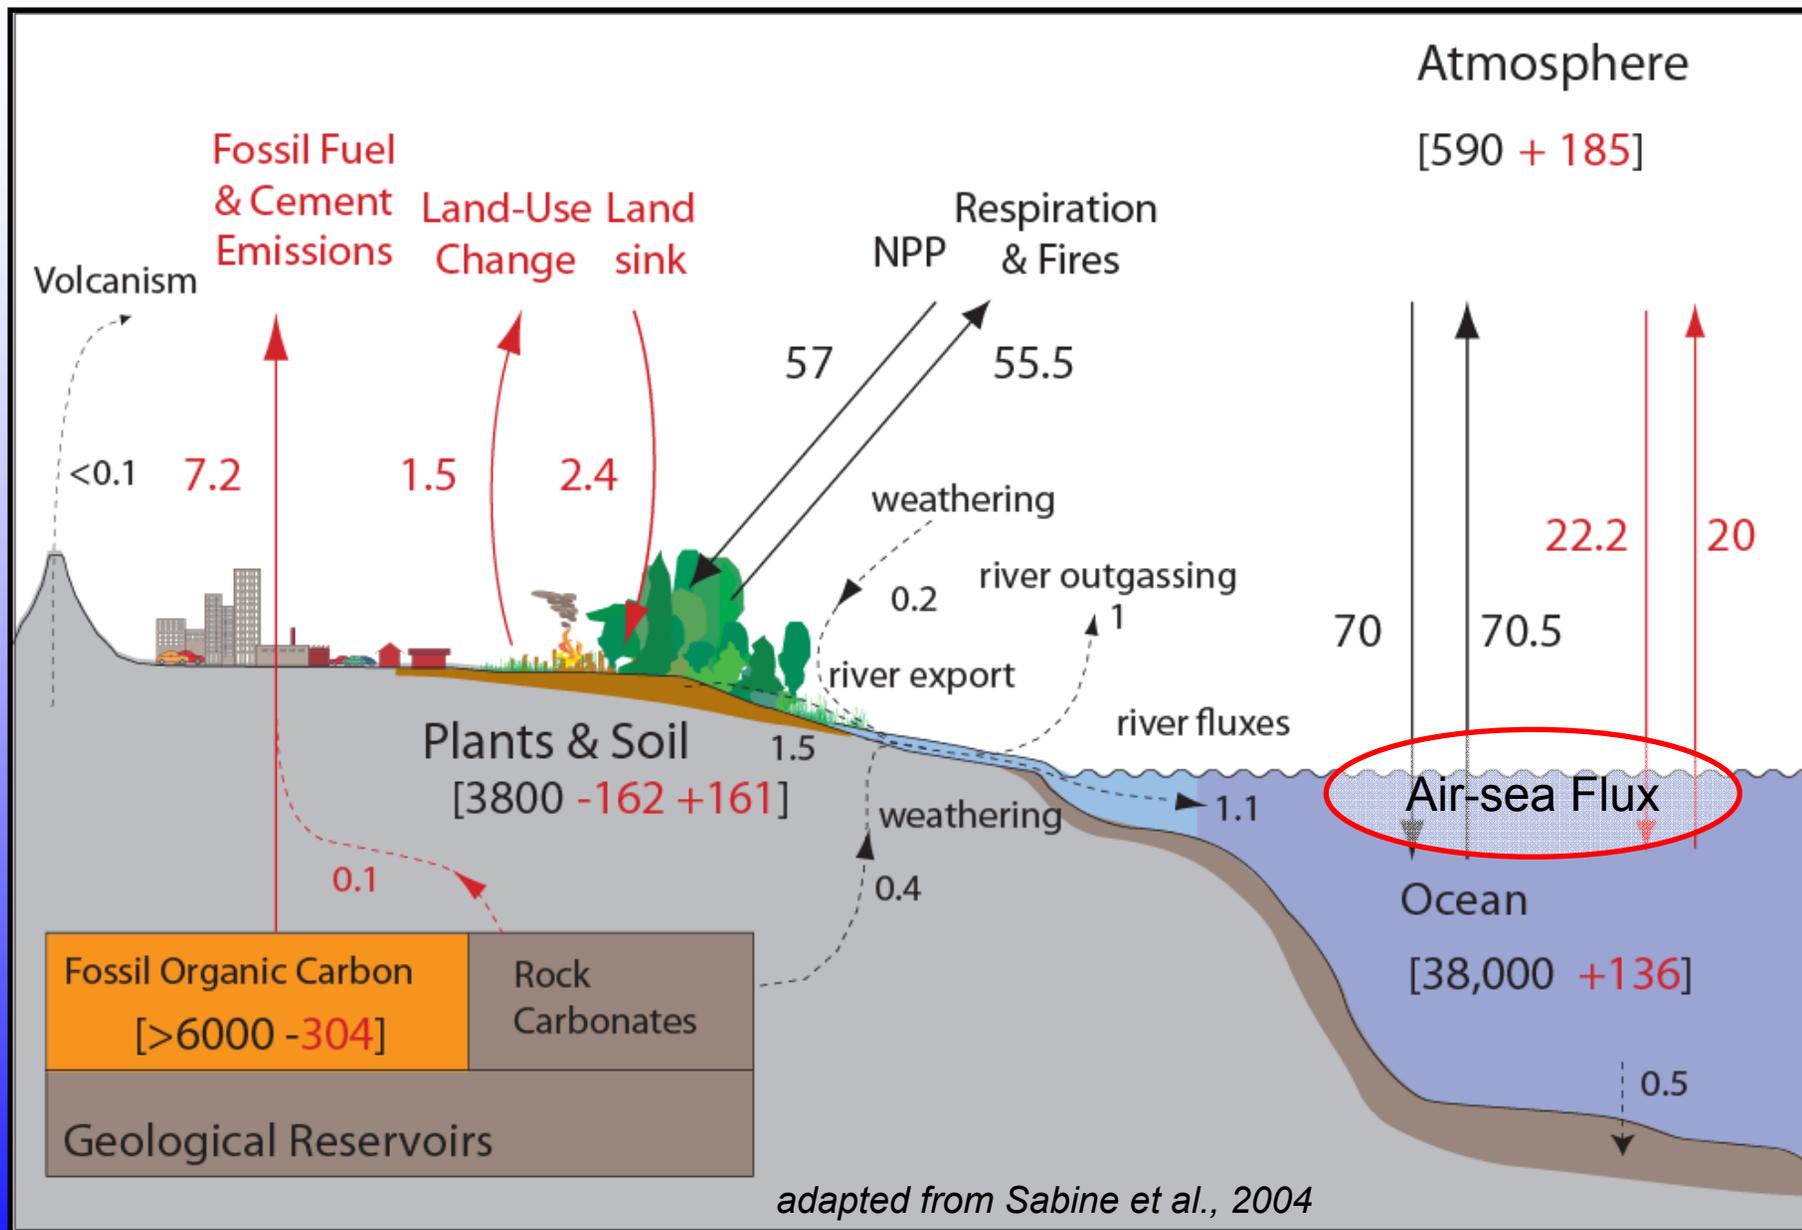

# Fate of Anthropogenic CO<sub>2</sub> Emissions (2000-2007)

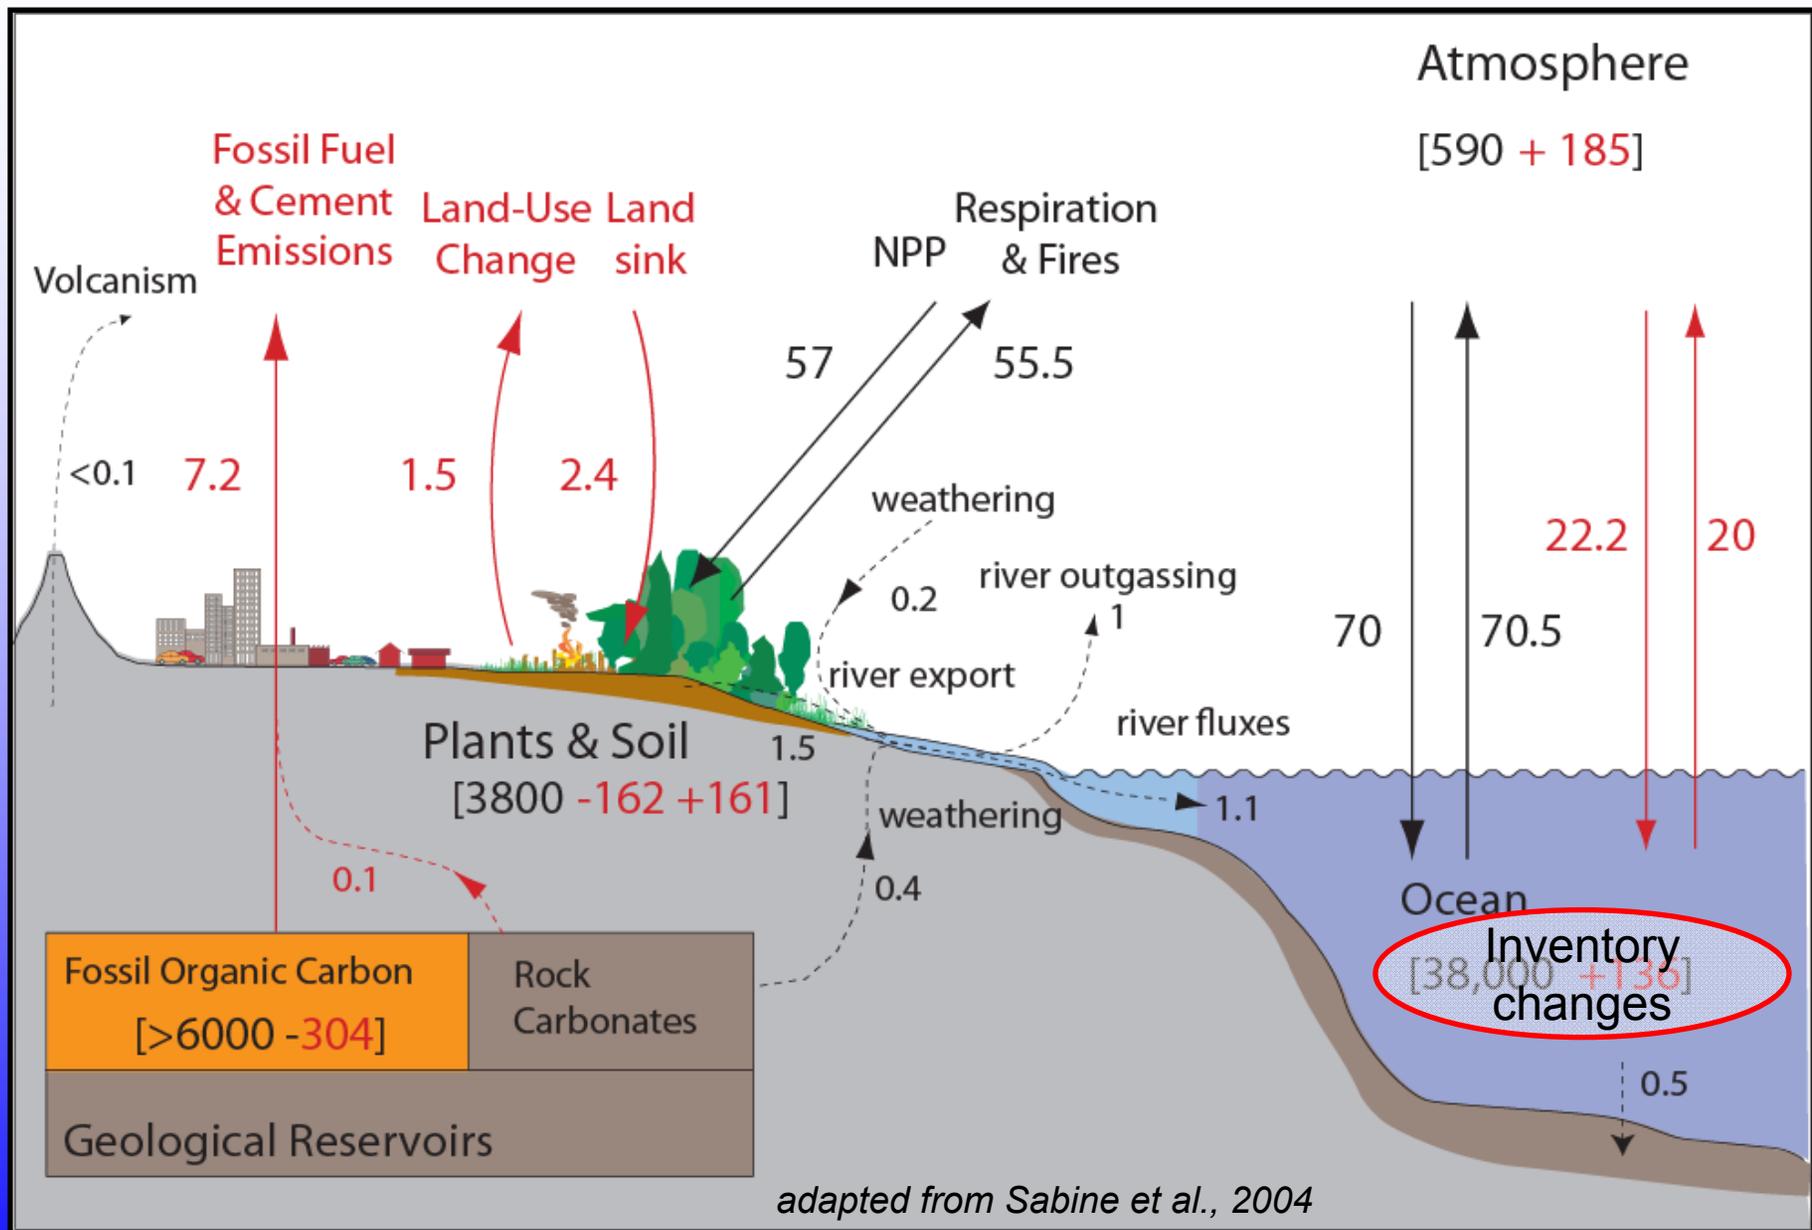

Atmospheric growth rate has increased 54% over the past 37 years; whereas the efficiency of ocean and land sinks have decreased 5% over the last 50 years.

Canadell et al. 2007, PNAS (updated)

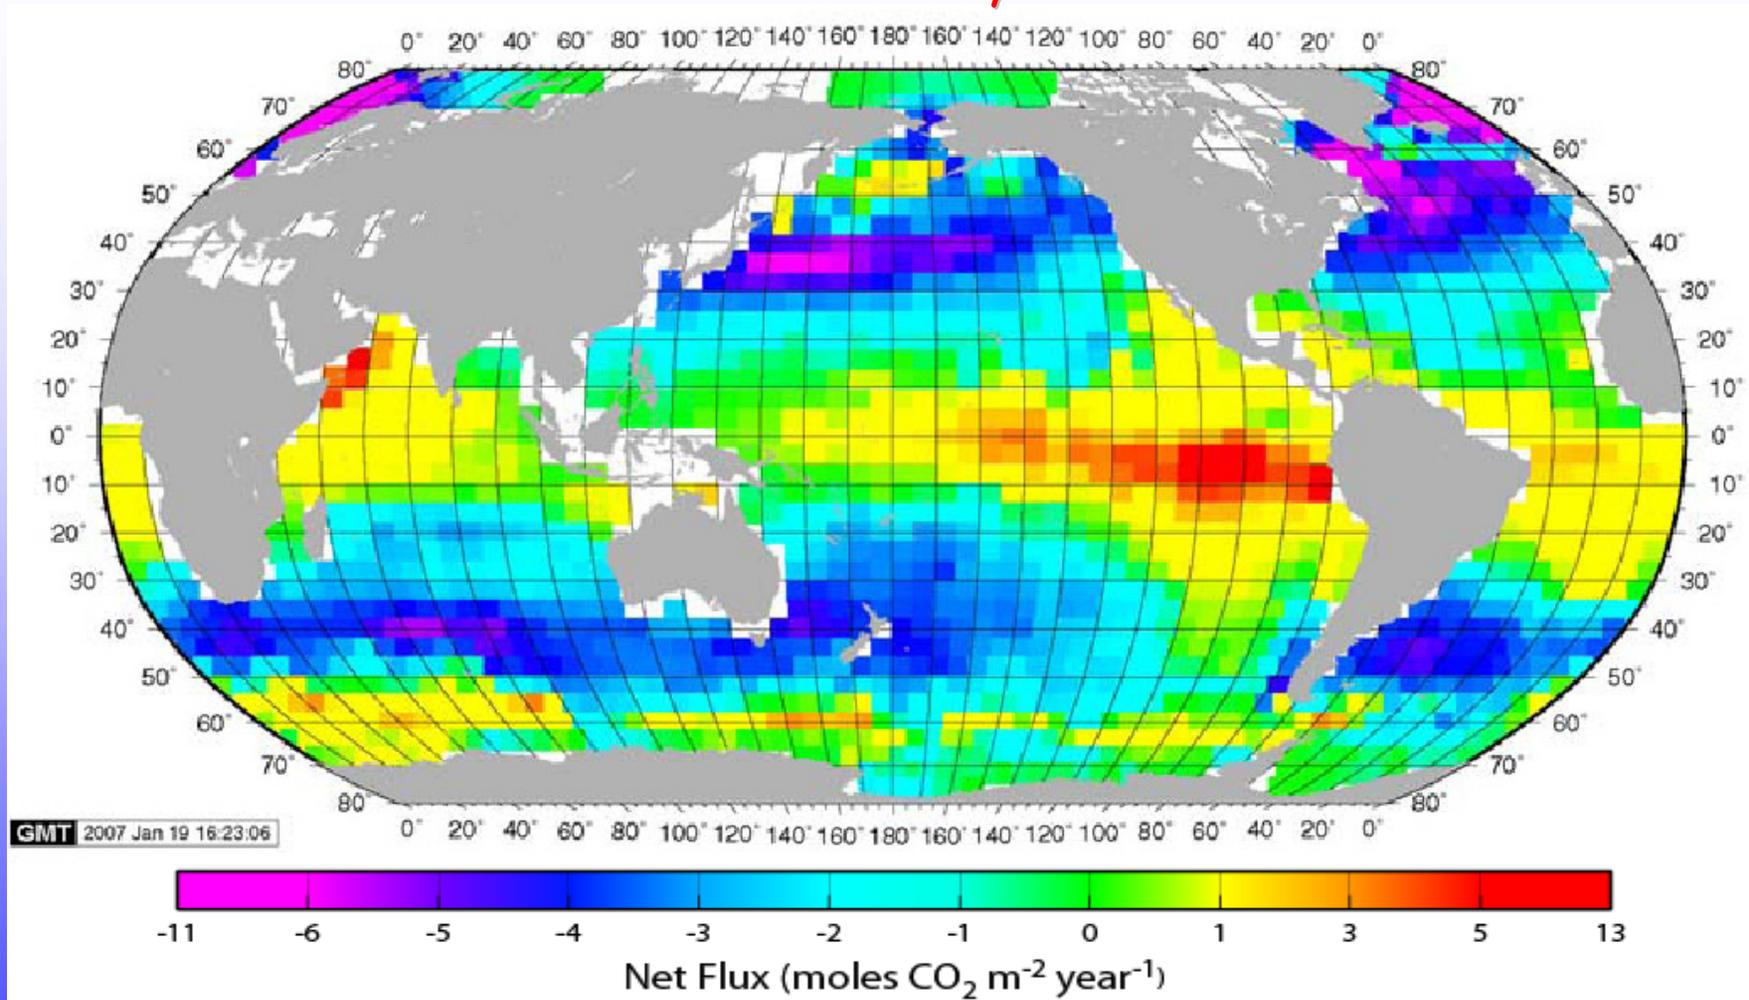

# Global Carbon Budget for 2000-2005

# Global Carbon Budget for 2000-2005

## Takahashi climatological annual mean air-sea $\text{CO}_2$ flux for reference year 2000

Based on ~3 million measurements since 1970 and  
NCEP/DOE/AMIP II reanalysis.  
Global flux is  $1.4 \pm 0.7 \text{ Pg C/yr}$

## Several Independent Approaches are Converging on an Estimate of the Anthropogenic CO<sub>2</sub> Uptake

Table 1. Summary of Recent Estimates of the Oceanic Uptake Rate of Anthropogenic CO<sub>2</sub> for the Period of the 1990s and Early 2000s

Method	Estimate (Pg C a <sup>-1</sup> )	Time Period	Authors
Estimates Based on Oceanic Observations			
Ocean Inversion (10 models)	-2.2 ± 0.3	Nominal 1995	this study and Mikaloff - Fletcher et al. [2006]
Ocean Inversion (3 models)	-1.8 ± 0.4	Nominal 1990	Gloor et al. [2003]
Air-sea pCO <sub>2</sub> difference (adjusted) <sup>a</sup>	-1.9 ± 0.7	Nominal 2000 <sup>b</sup>	Takahashi et al. [2008]
Air-sea pCO <sub>2</sub> difference (adjusted) <sup>a,c</sup>	-2.0 ± 60%	Nominal 1995	Takahashi et al. [2002]
Estimates Based on Atmospheric Observations			
Atmospheric O <sub>2</sub> /N <sub>2</sub> ratio	-1.9 ± 0.6	1990–1999	Manning and Keeling [2006]
Atmospheric O <sub>2</sub> /N <sub>2</sub> ratio	-2.2 ± 0.6	1993–2003	Manning and Keeling [2006]
Atmospheric O <sub>2</sub> /N <sub>2</sub> ratio	-1.7 ± 0.5	1993–2002	Bender et al. [2005]
Atmospheric CO <sub>2</sub> inversions (adjusted) <sup>a</sup>	-1.8 ± 1.0	1992–1996	Gurney et al. [2004]
Estimates Based on Oceanic and Atmospheric Observations			
Air-sea <sup>13</sup> C disequilibrium	-1.5 ± 0.9	1985–1995	Gruber and Keeling [2001]
Deconvolution of atm. δ <sup>13</sup> C and CO <sub>2</sub>	-2.0 ± 0.8	1985–1995	Joos et al. [1999a]
Joint atmosphere-ocean inversion	-2.1 ± 0.2	1992–1996	Jacobson et al. [2007b]
Estimates Based on Ocean Biogeochemistry Models			
OCMIP-2 (13 models)	-2.4 ± 0.5	1990–1999	Watson and Orr [2003]
OCMIP-2 (4 “best” models) <sup>d</sup>	-2.2 ± 0.2	1990–1999	Matsumoto et al. [2004]

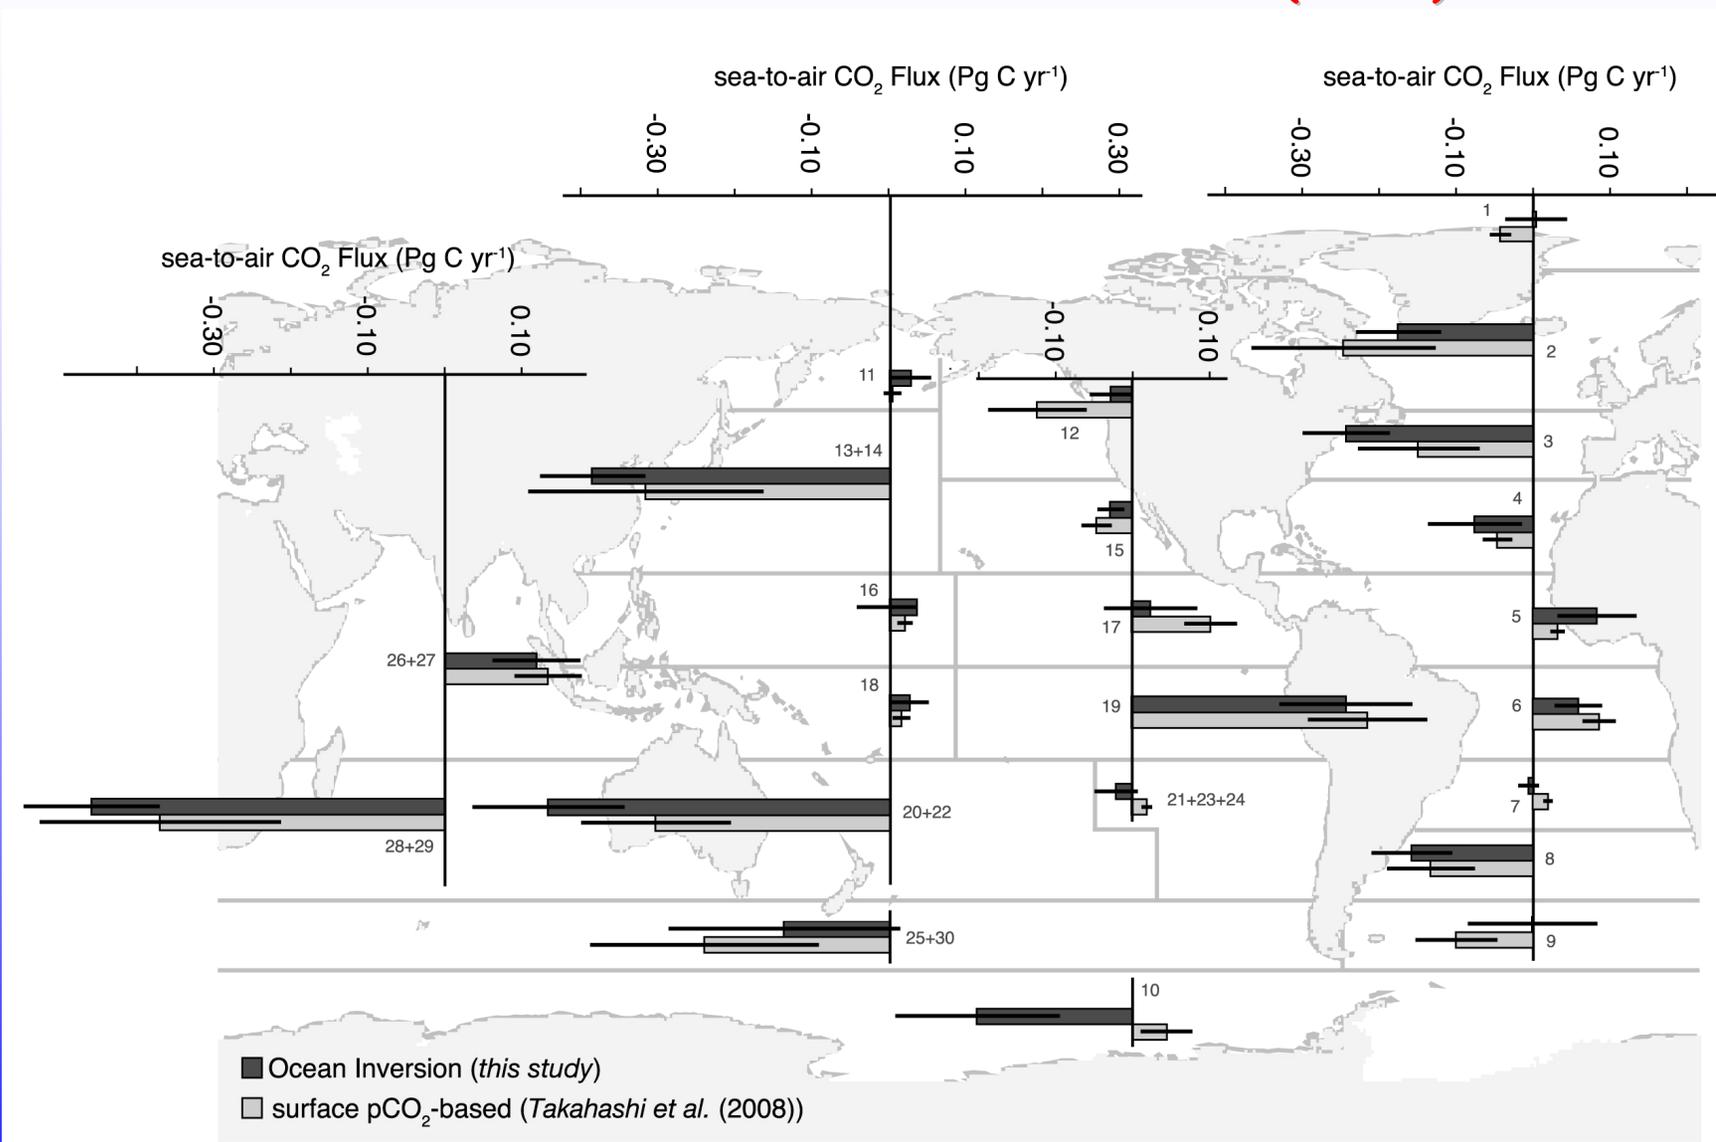

<sup>a</sup> Adjusted by 0.45 Pg C a<sup>-1</sup> to account for the outgassing of natural CO<sub>2</sub> that is driven by the carbon input by rivers.

<sup>b</sup> The estimate for a nominal year of 1995 would be less than 0.1 Pg C a<sup>-1</sup> smaller.

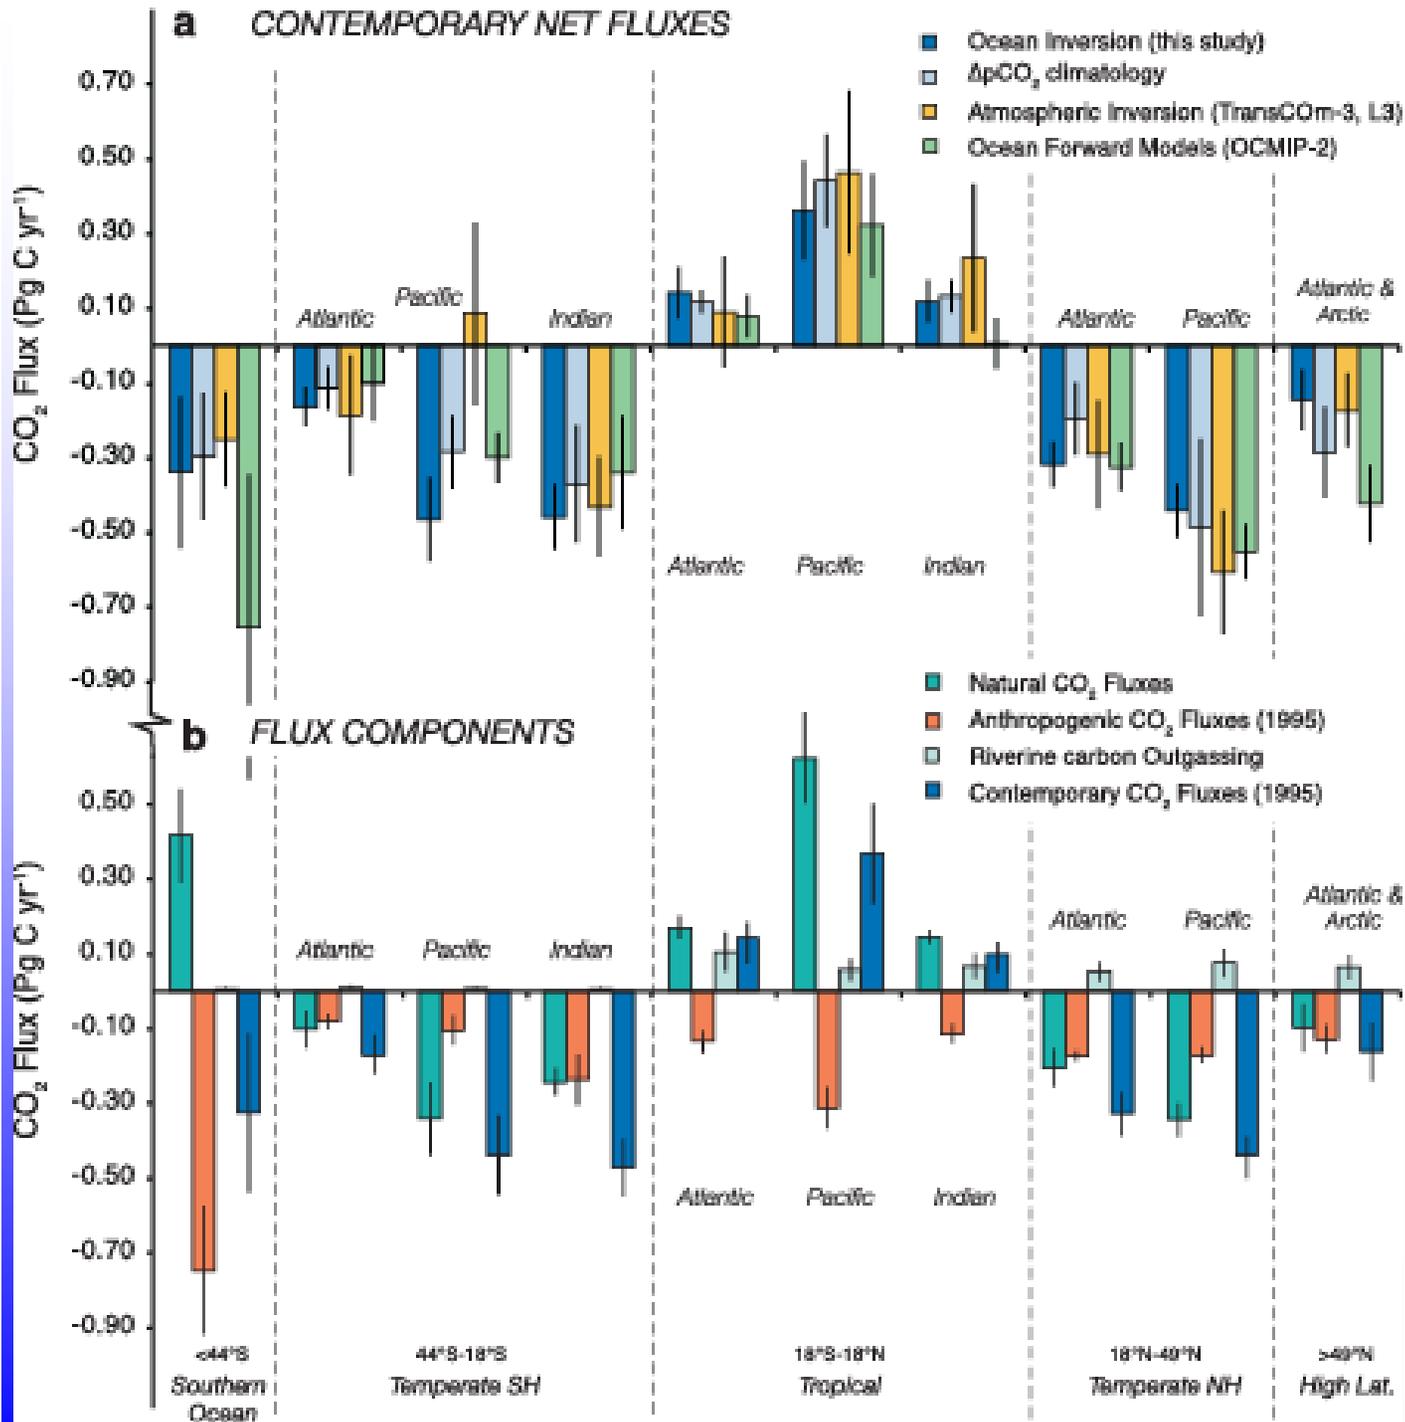

<sup>c</sup> Corrected for wrong windspeeds used in published version; see [http://www.ldeo.columbia.edu/res/pi/CO2/carbondioxide/pages/air\\_sea\\_flux\\_rev1.html](http://www.ldeo.columbia.edu/res/pi/CO2/carbondioxide/pages/air_sea_flux_rev1.html).

<sup>d</sup> These models were selected on the basis of their ability to simulate correctly, within the uncertainty of the data, the observed oceanic inventories and regional distributions of chlorofluorocarbon and bomb radiocarbon.

# Comparison of Ocean Inversion Model of air-sea CO<sub>2</sub> net flux with observations based on Takahashi et al (2009)

From Gruber et al., Glob. Biogeochem. Cy., V 23, doi:10.1029/2008GB003349, 2009

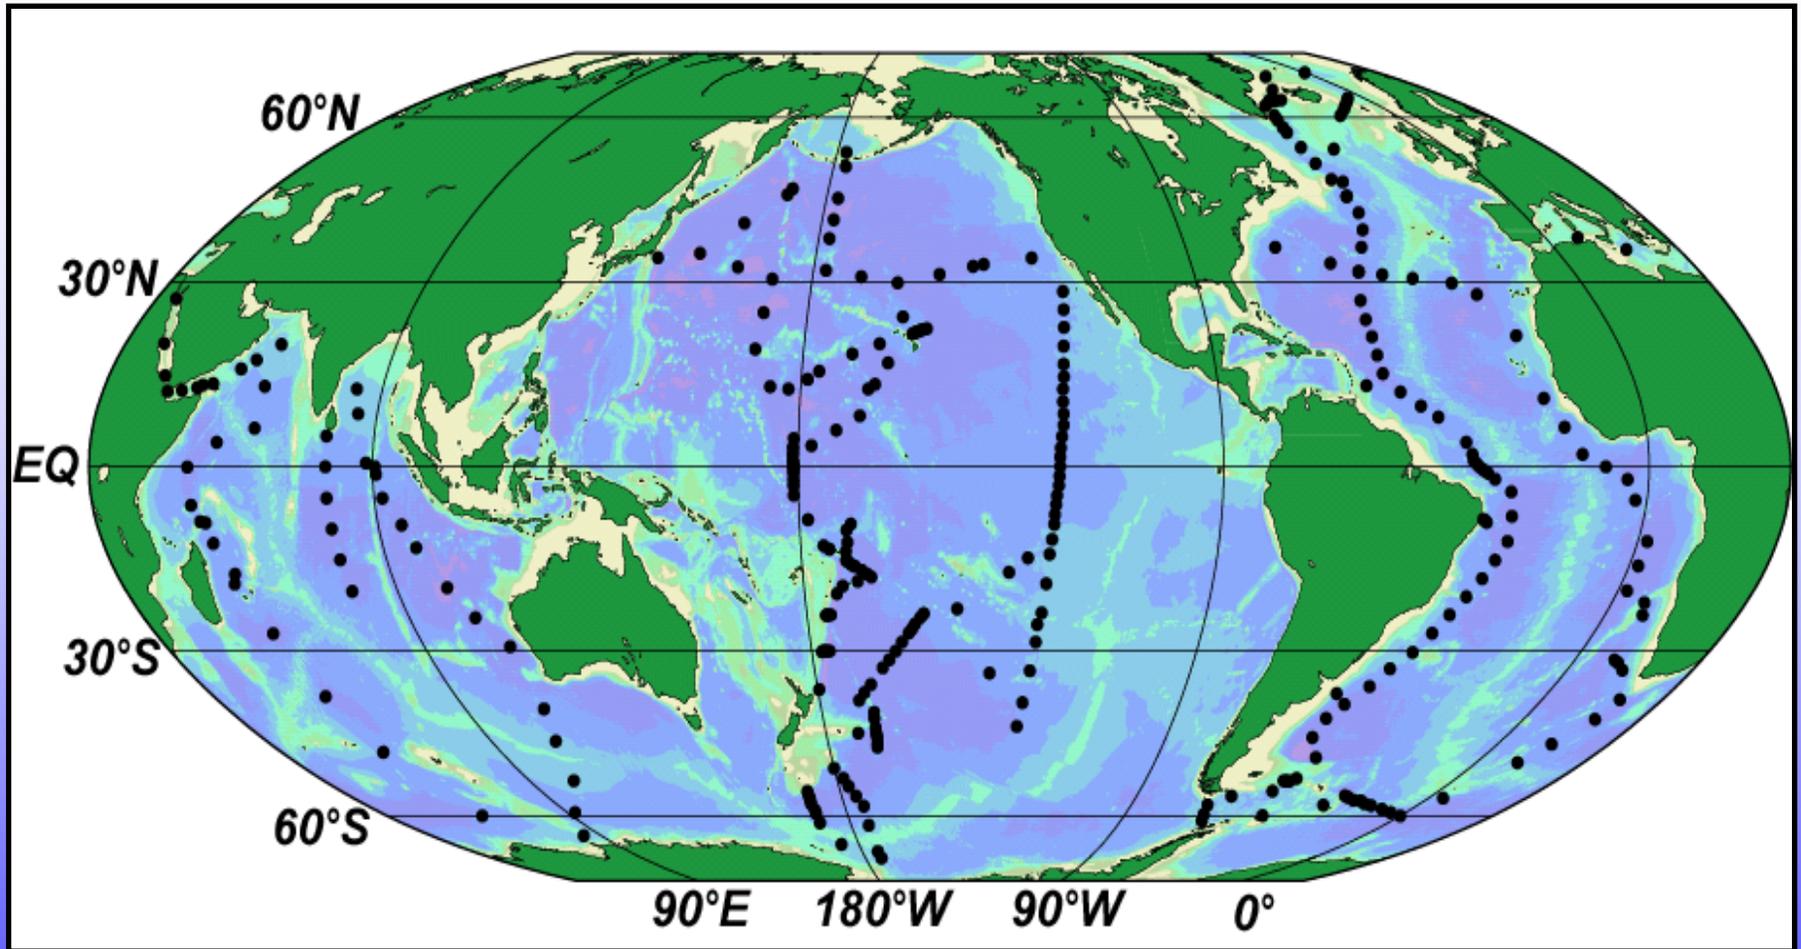

Summary of carbon fluxes from Gruber et al. 2009

An example of the differences between uptake and storage can be found in the Tropical Pacific

Tropical Pacific shows up as a significant sink for CO<sub>2</sub> despite the fact that net fluxes are out of the ocean and inventory estimates show a minimum near the equator

## GEOSECS Station Locations

Much of our understanding of the modern ocean carbon cycle was based on the *GEOSECS* program of the 1970s.

6,037 carbon samples with a DIC uncertainty  $\sim 20 \mu\text{mol kg}^{-1}$

Shortly after GEOSECS was completed two papers came out at about the same time suggesting similar approaches for estimating anthropogenic  $\text{CO}_2$  from the ocean carbon measurements:

Brewer, P.G., Direct observation of the oceanic  $\text{CO}_2$  increase, *Geophys. Res. Lett.*, 5, 997-1000, 1978.

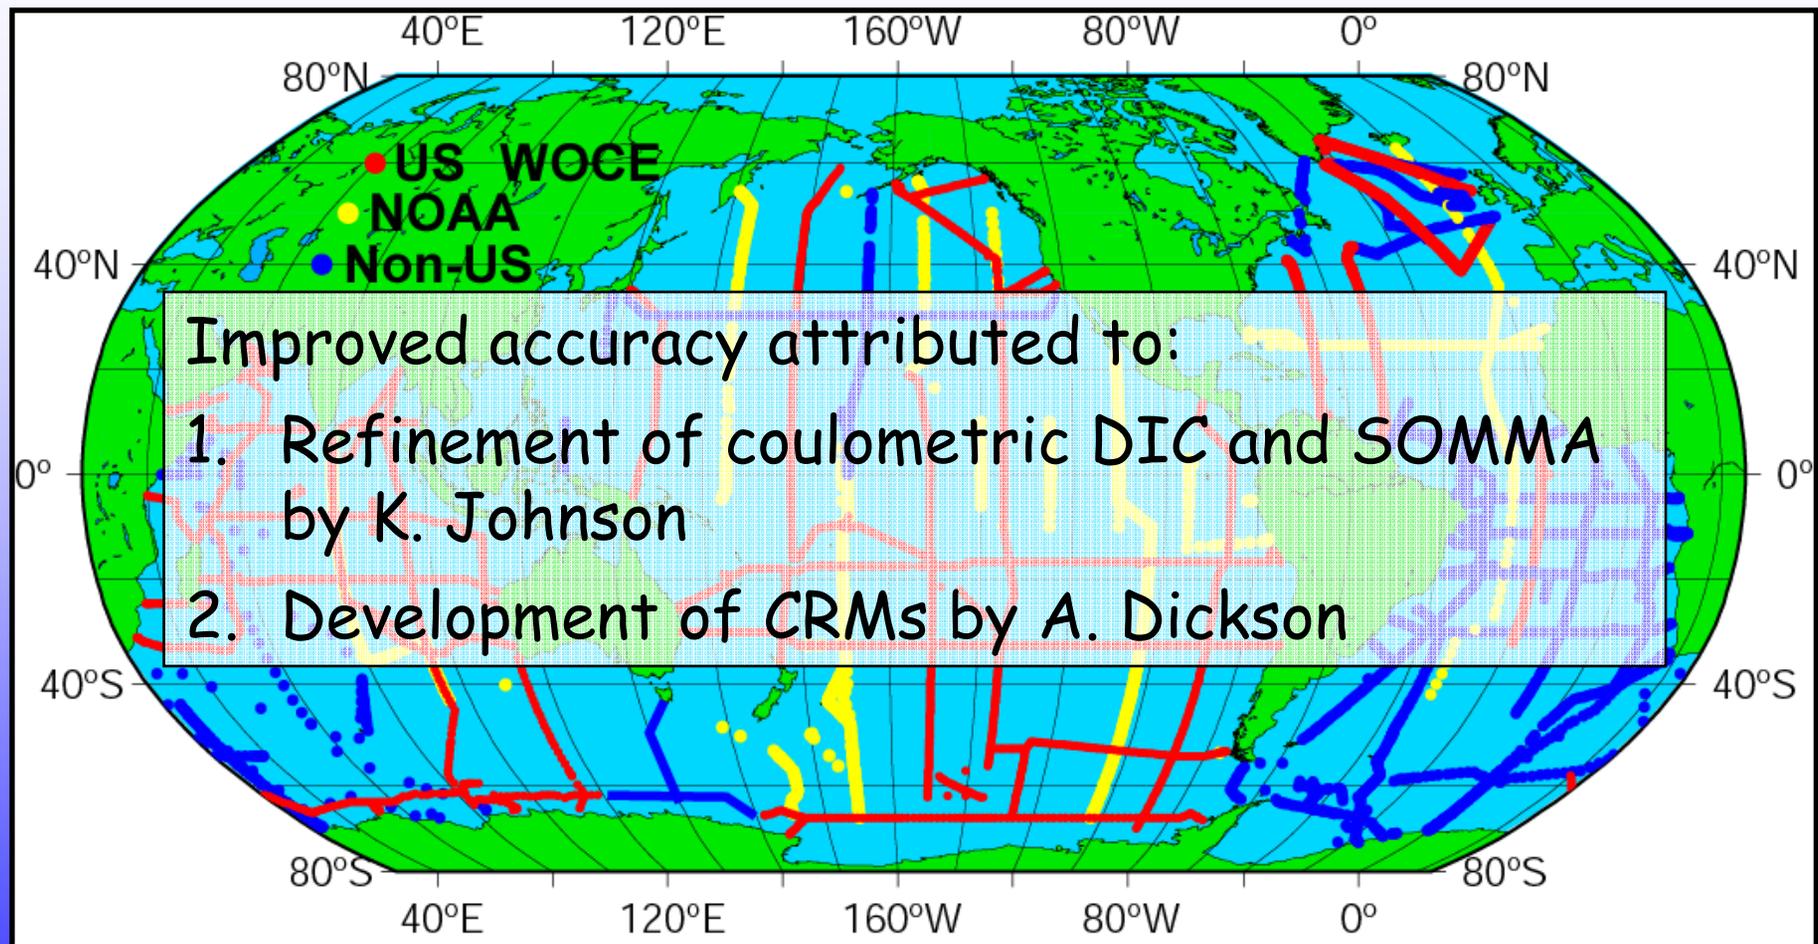

Chen, C.-T. A. and F. J. Millero, Gradual increase of oceanic  $\text{CO}_2$ , *Nature*, 277, 205-206, 1979.

$$C_{\text{anth}} = C_{\text{m}} - \Delta C_{\text{bio}} - C_{\text{pre}}$$

"...unless [inorganic carbon] measurements that are more accurate by an order of magnitude can be made, at least a decade will pass before direct confirmation of the model-based [fossil fuel  $\text{CO}_2$  uptake] estimates will be obtained."

Broecker et al., *Science*, 206, p. 409, 1979

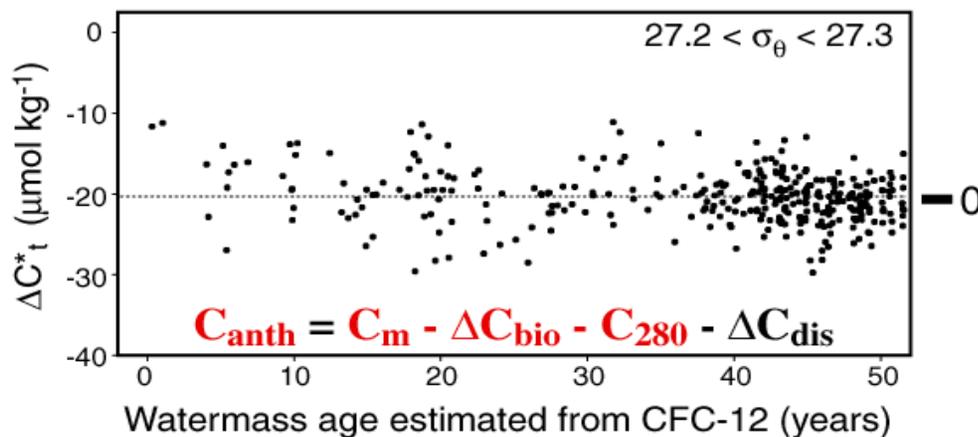

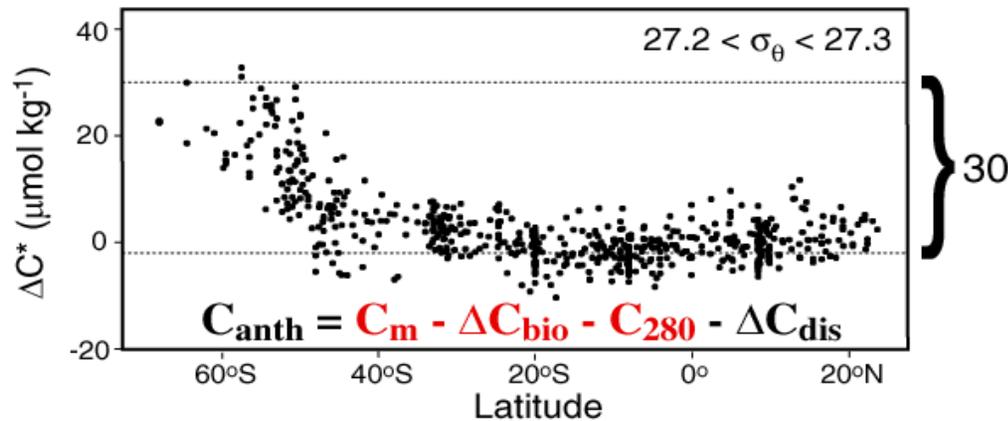

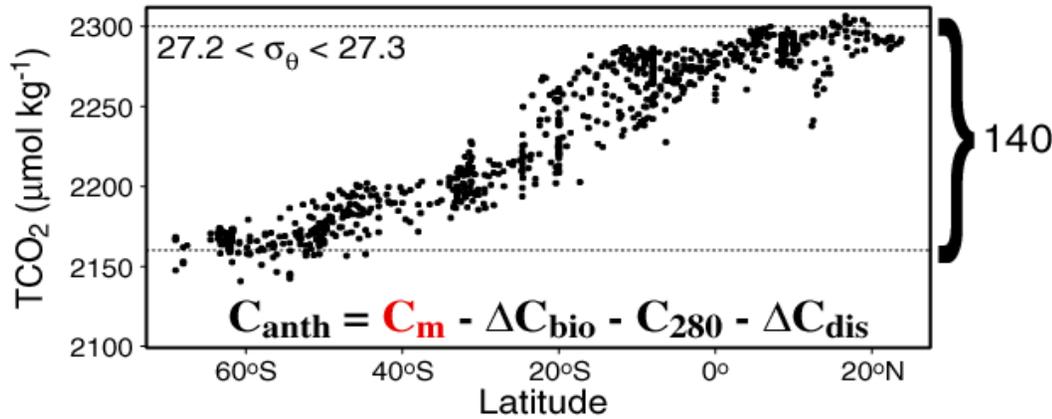

In the early 1990s the World Ocean Circulation Experiment (WOCE), the Joint Global Ocean Flux Study (JGOFS), and the NOAA/OACES program joined forces to conduct a global survey of  $\text{CO}_2$  in the oceans.

>70,000 sample locations;  $\text{DIC} \pm 2 \mu\text{mol kg}^{-1}$ ;  $\text{TA} \pm 4 \mu\text{mol kg}^{-1}$

[http://cdiac.esd.ornl.gov/oceans/glodap/Glodap\\_home.htm](http://cdiac.esd.ornl.gov/oceans/glodap/Glodap_home.htm)

Gruber, N., J. L. Sarmiento and T. F. Stocker, An improved method for detecting anthropogenic CO<sub>2</sub> in the oceans, *Global Biogeochem. Cycles*, 10, 809-837, 1996.

$$C_{\text{anth}} = C_{\text{m}} - \Delta C_{\text{bio}} - C_{280} - \Delta C_{\text{dis}}$$

Where:

C<sub>anth</sub> = Anthropogenic C concentration

C<sub>m</sub> = Measured total C concentration

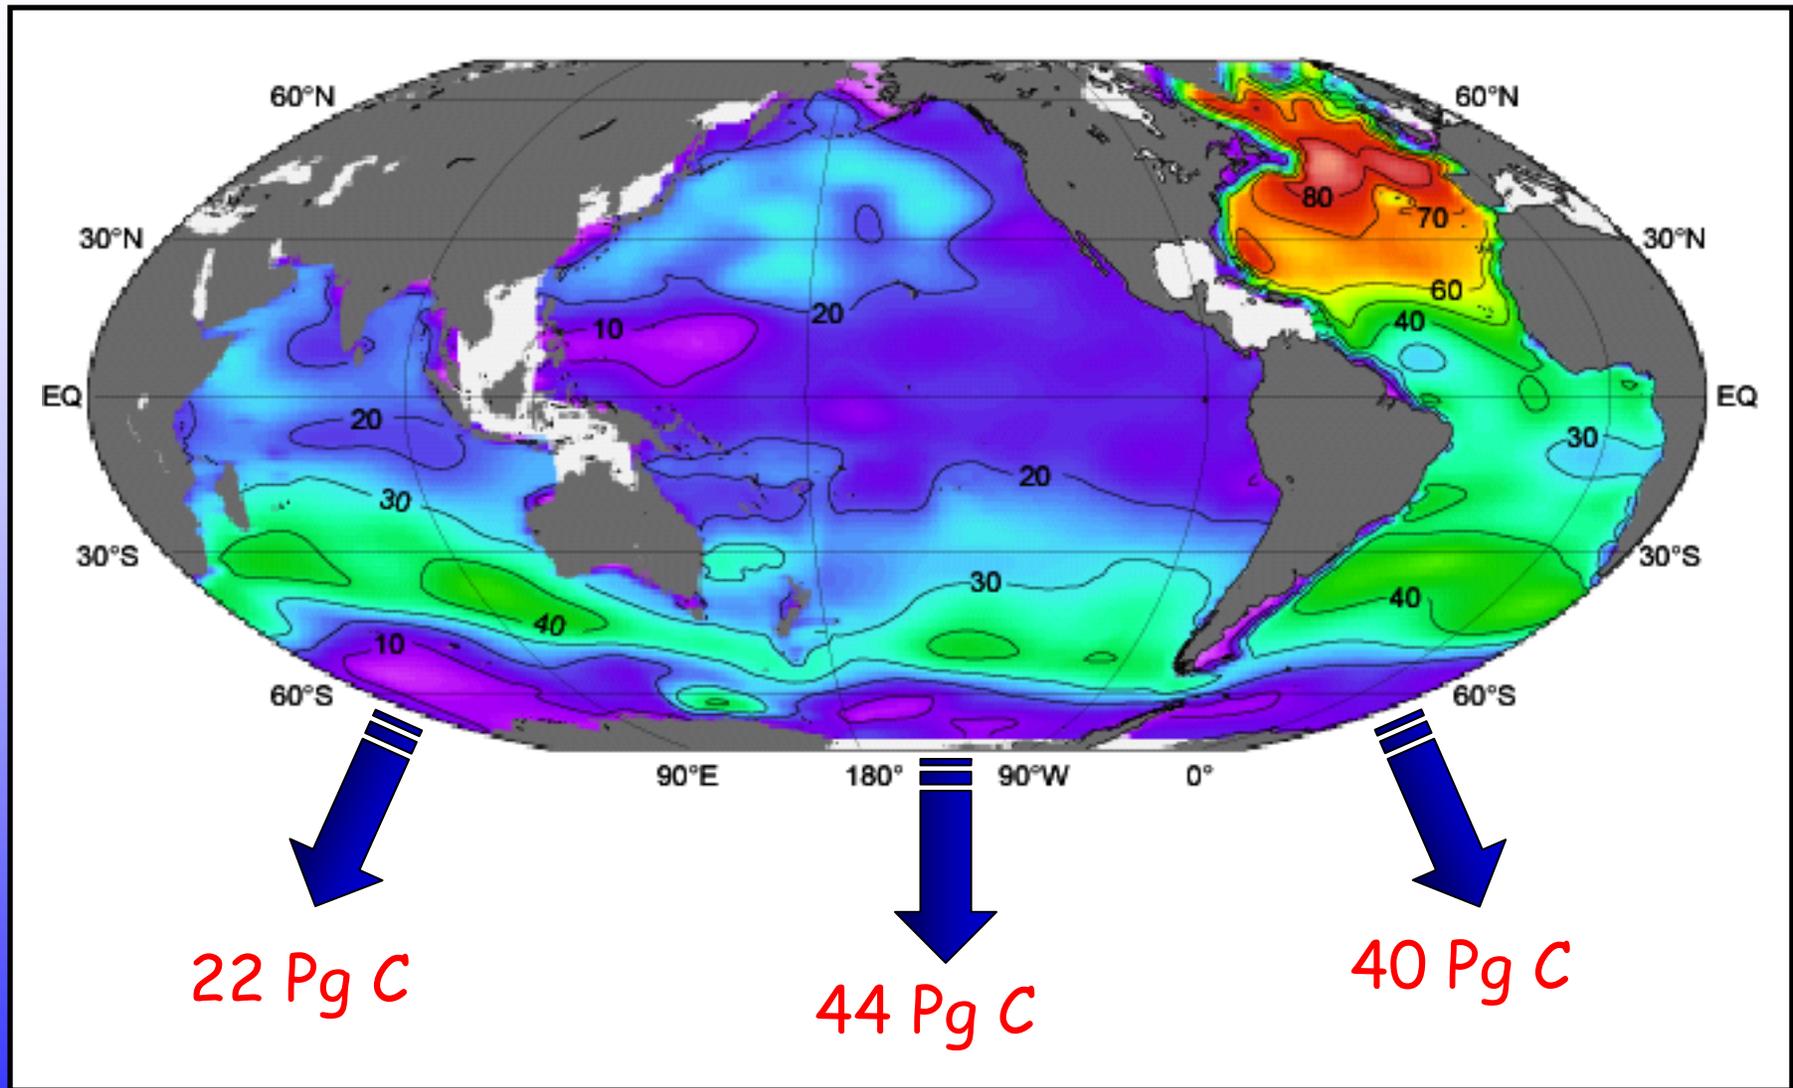

ΔC<sub>bio</sub> = Change in TCO<sub>2</sub> as a result of biological activity

C<sub>280</sub> = TCO<sub>2</sub> of waters in equilibrium with a preindustrial atmospheric CO<sub>2</sub> concentration of 280 μatm

ΔC<sub>dis</sub> = Air-sea difference in CO<sub>2</sub> concentration in μmol kg<sup>-1</sup> of TCO<sub>2</sub>

$$\Delta C^* = C_{\text{m}} - \Delta C_{\text{bio}} - C_{280} = C_{\text{anth}} + \Delta C_{\text{dis}}$$

Column inventory of anthropogenic  $\text{CO}_2$  that has accumulated in the ocean between 1800 and 1994 ( $\text{mol m}^{-2}$ ) based on  $\Delta C^*$  approach

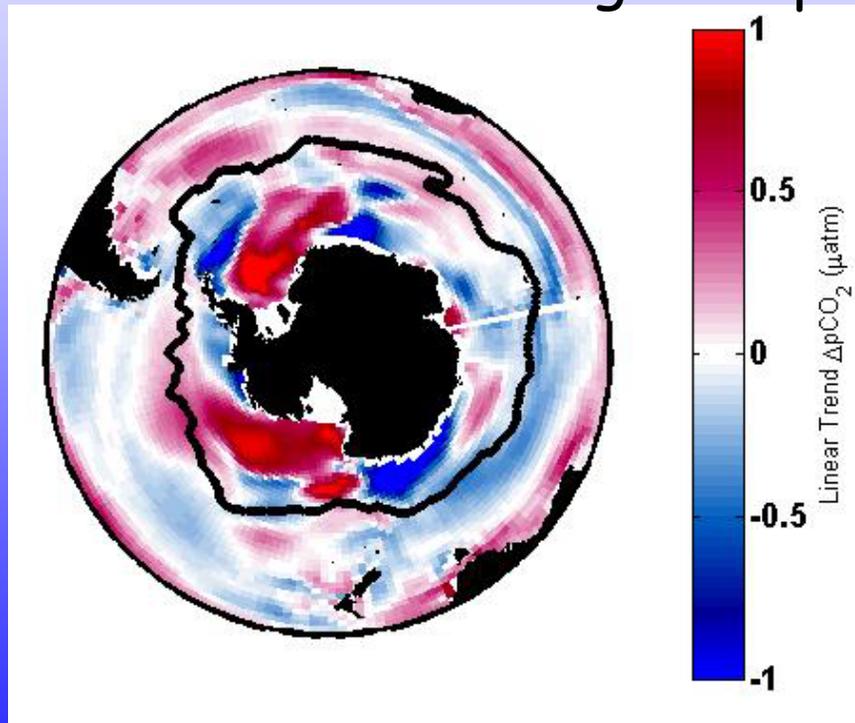

Mapped Inventory =  $106 \pm 17$  Pg C; Global Inventory =  $118 \pm 19$  Pg C

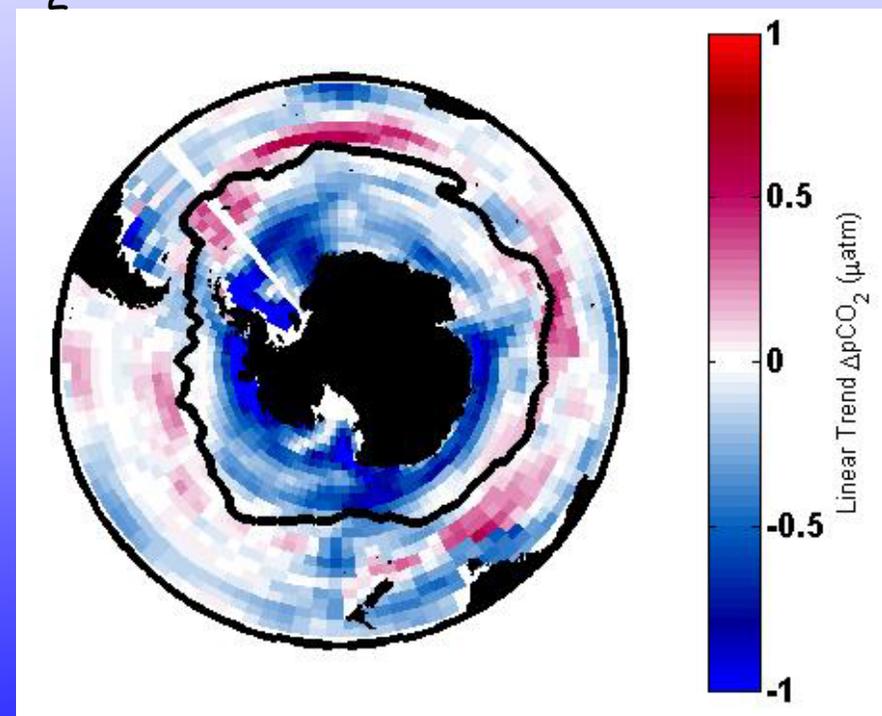

Knowing the total distribution of anthropogenic  $\text{CO}_2$  is great, but what we really want to know is how is the ocean storage of carbon changing with time?

For Example...is the Southern Ocean sink for carbon saturating?

### Change in $\Delta p\text{CO}_2$ 1979-2005

Le Quere 2007

Lovenduski 2008

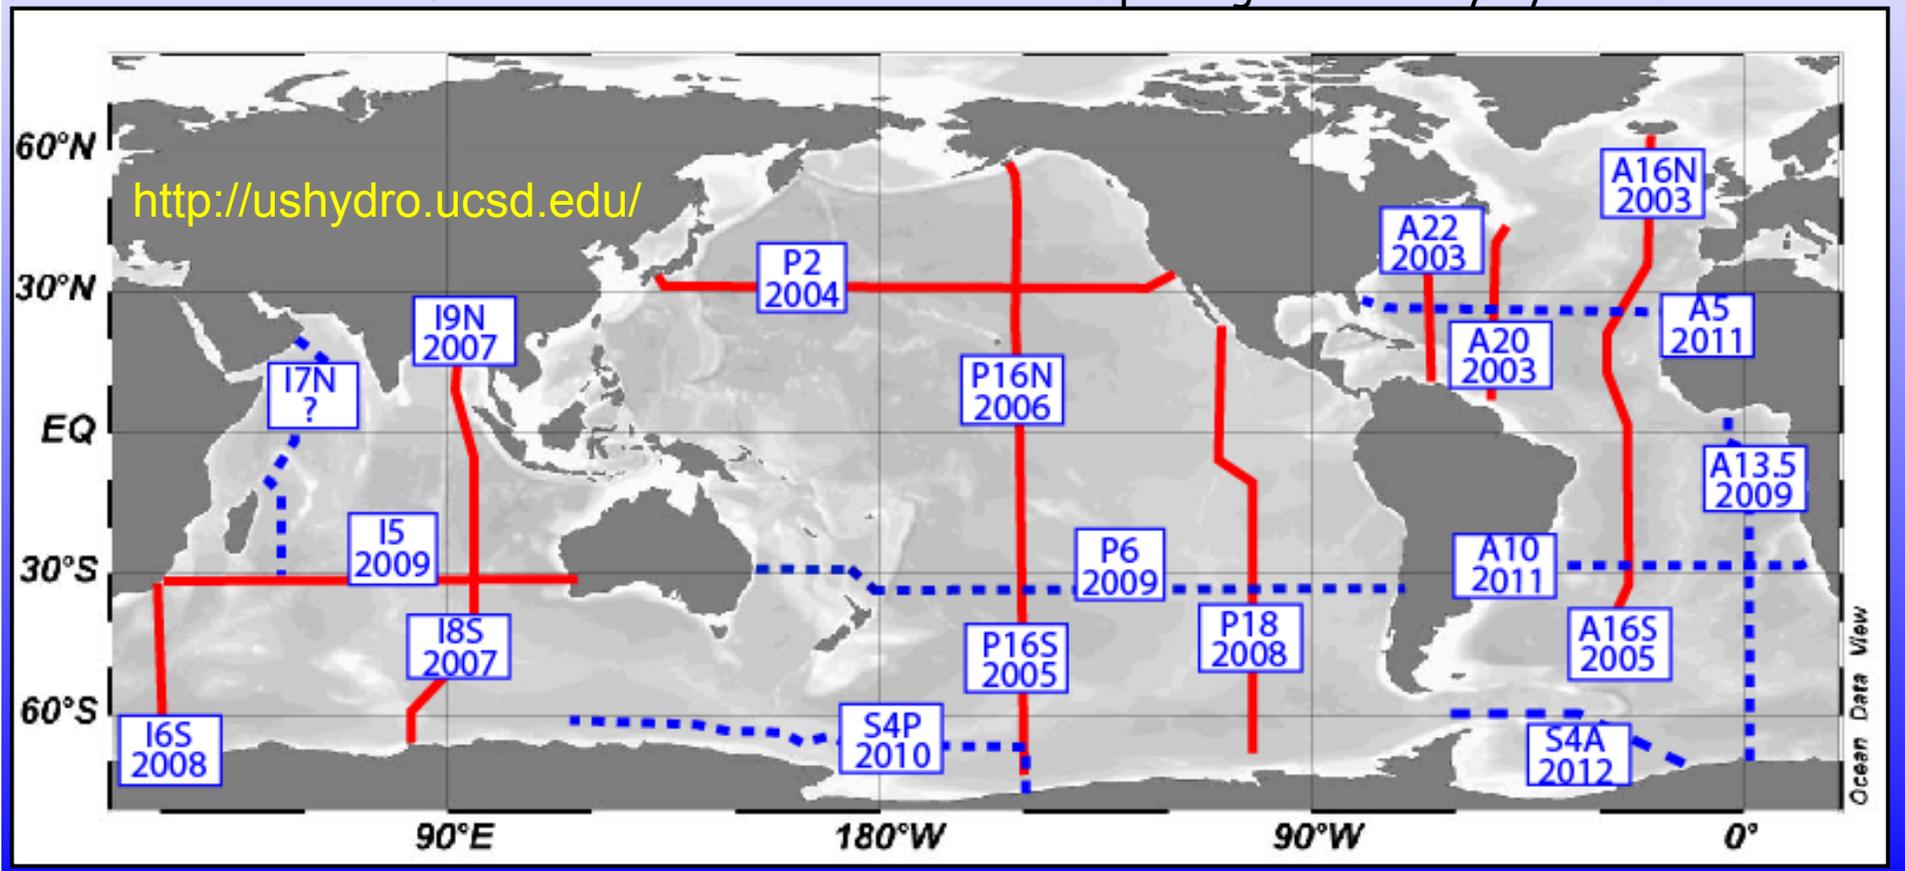

# US CLIVAR/CO<sub>2</sub> Repeat Hydrography Program

**Goal:** To quantify decadal changes in the inventory and transport of heat, fresh water, carbon dioxide (CO<sub>2</sub>), chlorofluorocarbon tracers and related parameters in the oceans.

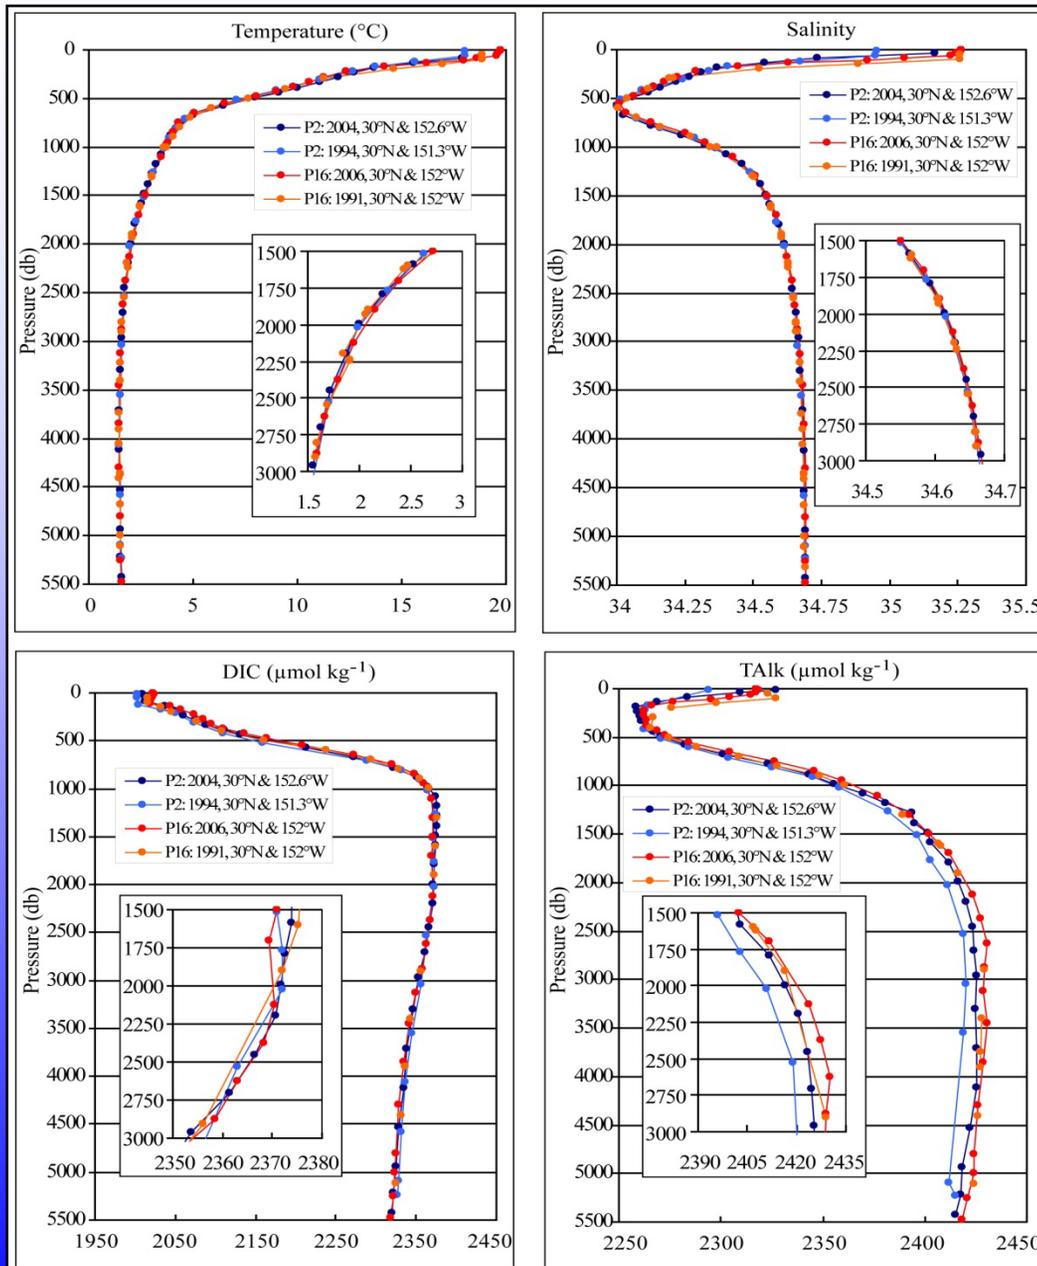

**Approach:** The sequence and timing of the U.S. CLIVAR/CO<sub>2</sub> Repeat Hydrography cruises have been selected so that there is roughly a decade between them and the WOCE/JGOFS global survey.

**Achievements:** The U.S. CLIVAR/CO<sub>2</sub> Repeat Hydrography Program has completed 12 of 18 lines and is on schedule to complete global survey by 2011.

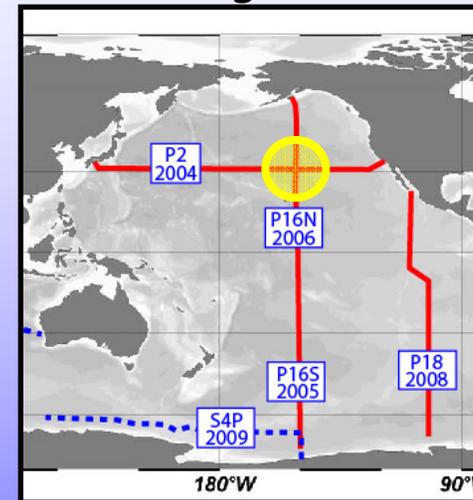

## Comparison of profiles from stations near the intersection of P2 and P16N.

Repeat Hydrography Data  
Are Very High Quality

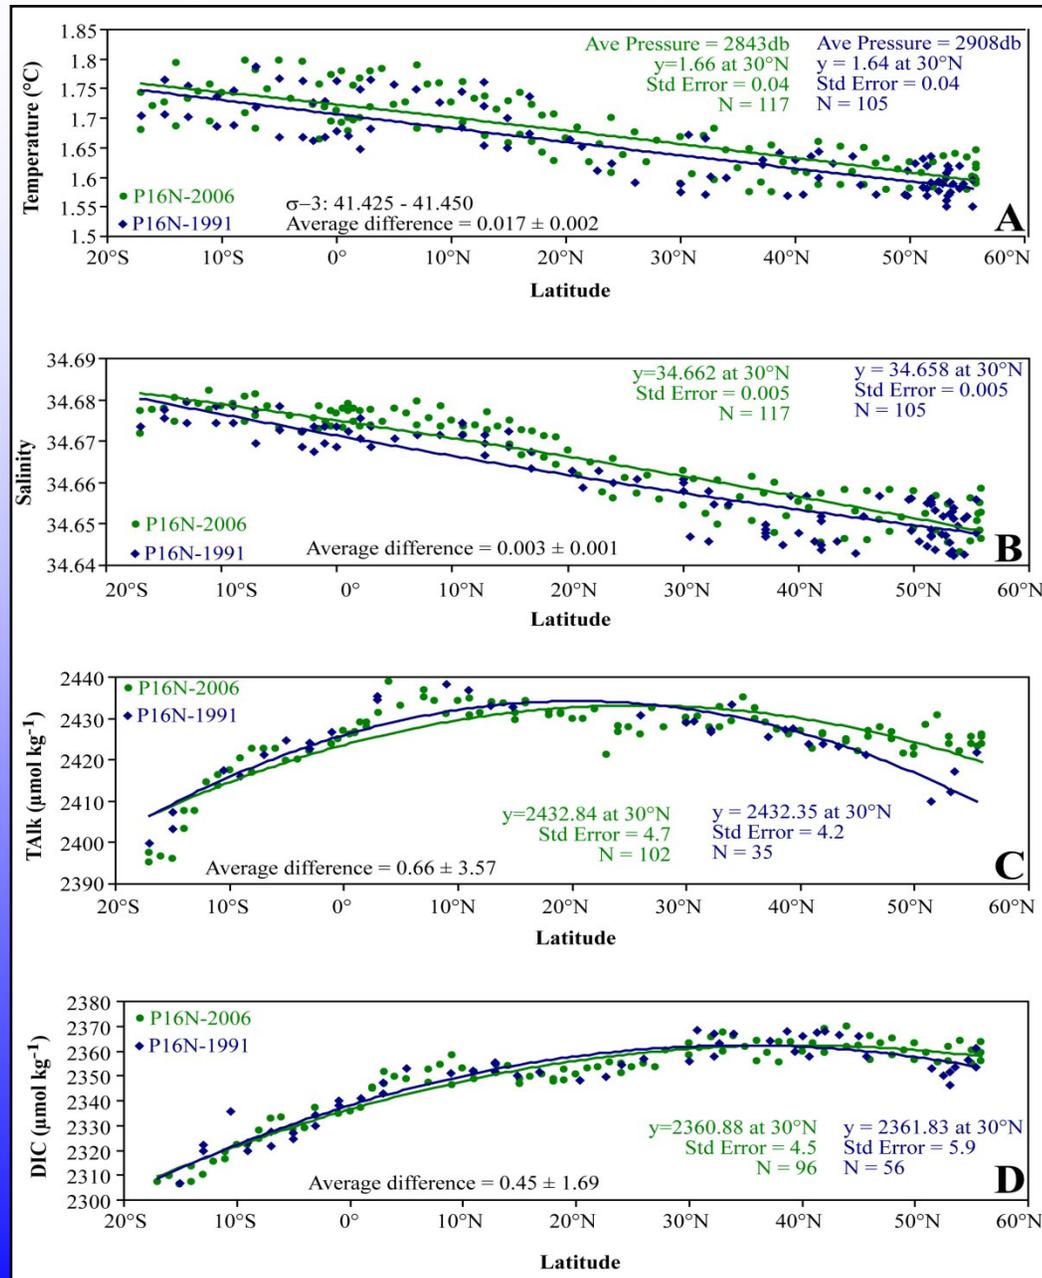

P02 along 30°N  
Japan to San Diego, CA  
June-August 2004

P16N along 152°W  
Tahiti to Kodiak, AK  
Feb.-March 2006

Comparison of crossover and overlap stations indicate the DIC data are good to  $\pm 1 \mu\text{mol kg}^{-1}$  and alkalinity data are good to  $\pm 2 \mu\text{mol kg}^{-1}$

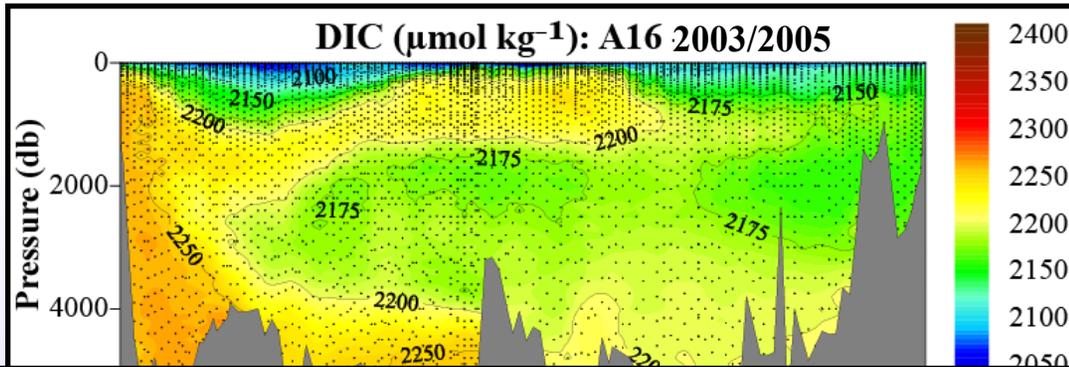

# Comparison of 1991 P16N data with 2006 P16N data along 41.425-41.450 $\sigma_3$ isopycnal surface.

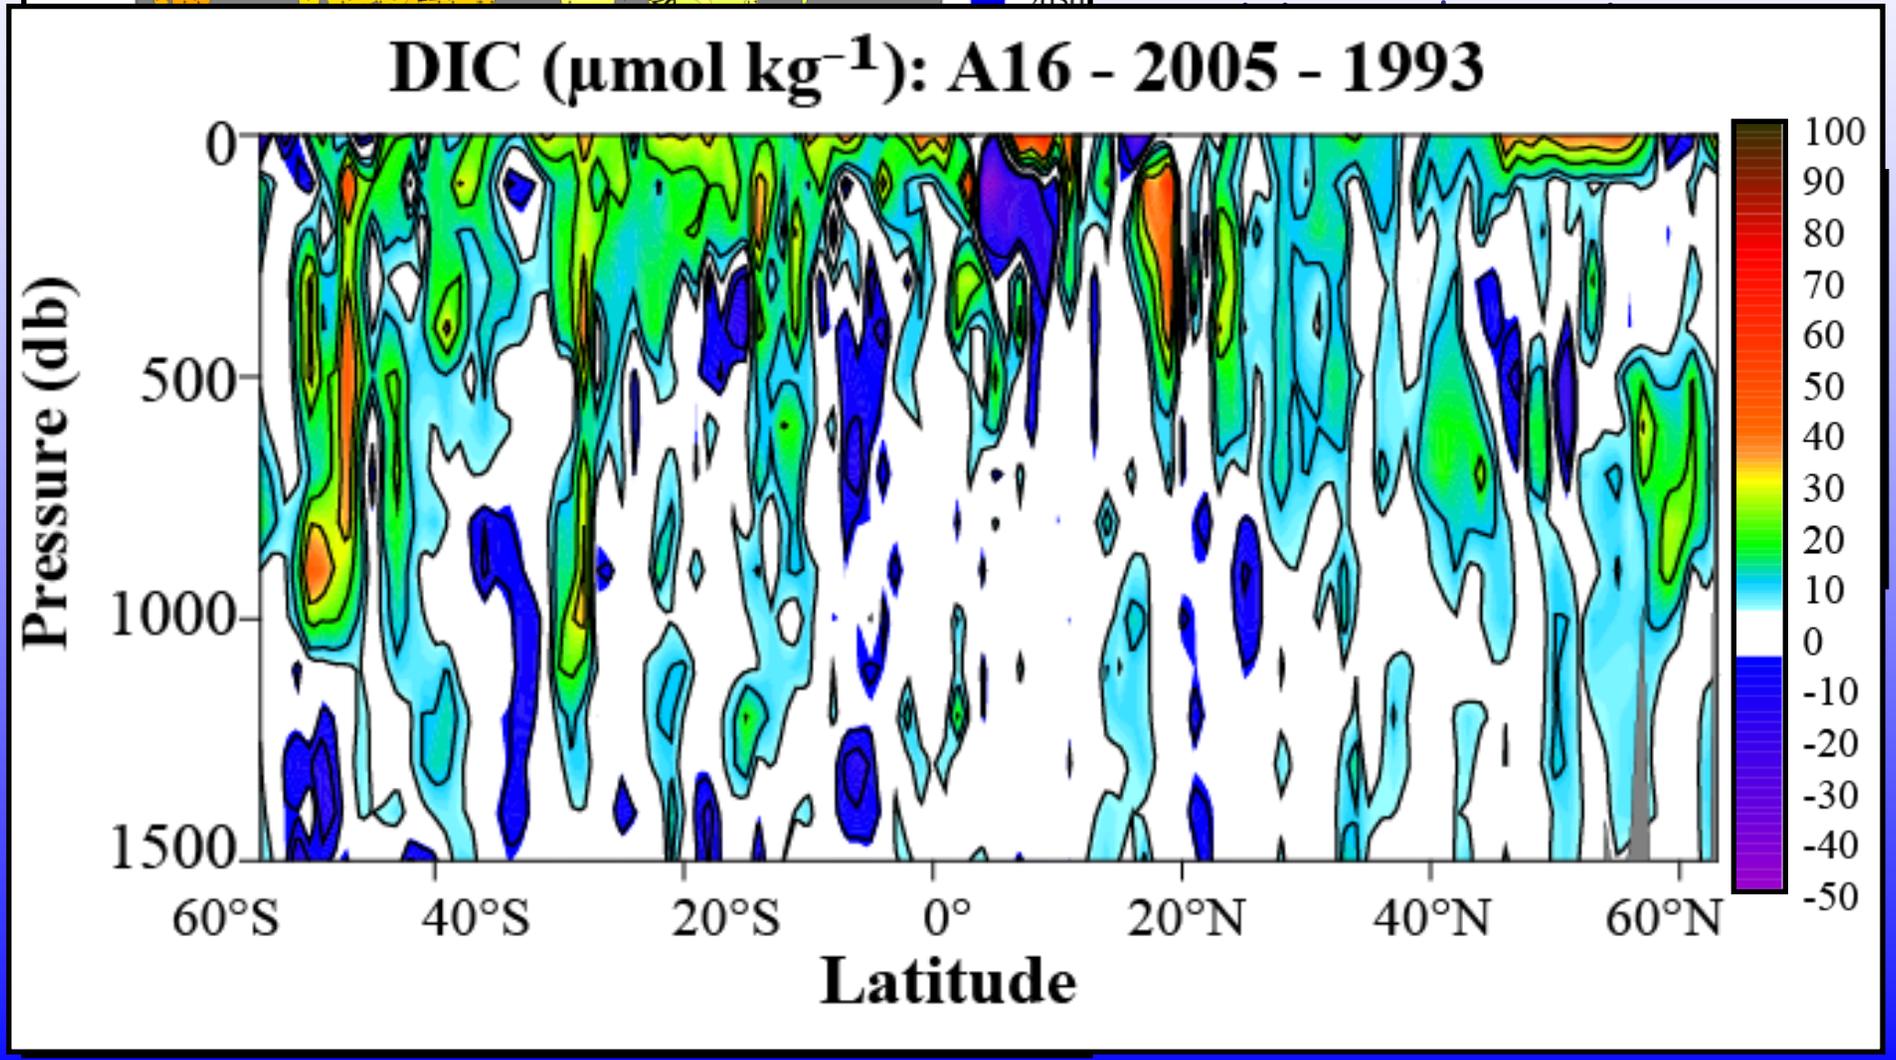

## Repeat Hydrography Data Agree Well With Historical Data

These cruises repeat WOCE lines P02 occupied in 1994 (10 yr diff.)  
 P16S/P16A in 1991/2 (14 yr diff.)  
 P16C/P16N in 1991 (15 yr diff.)

Comparison of deep waters on isopycnal surfaces show no significant offsets between Repeat Hydrography and WOCE cruises.

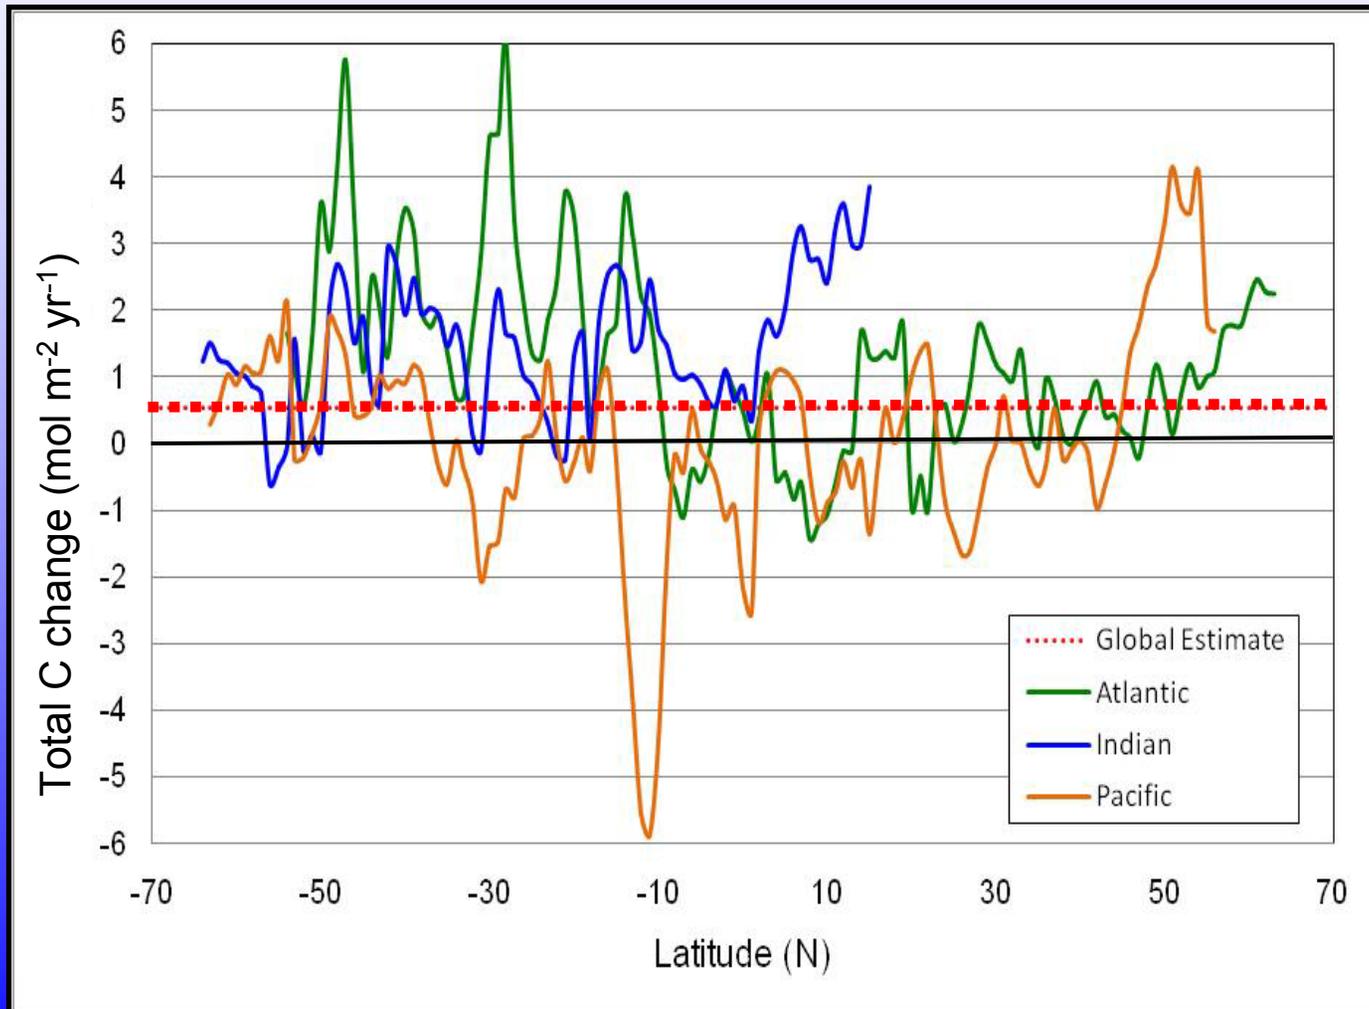

The first order Atlantic DIC distributions look very similar to each other but there are significant differences with both

## Measured DIC changes show large variability on small spatial scales

- DIC from each cruise gridded as a function of Latitude and potential density
- The two grids are subtracted
- DIC changes are summed for each station and plotted as a function of Latitude

### Average:

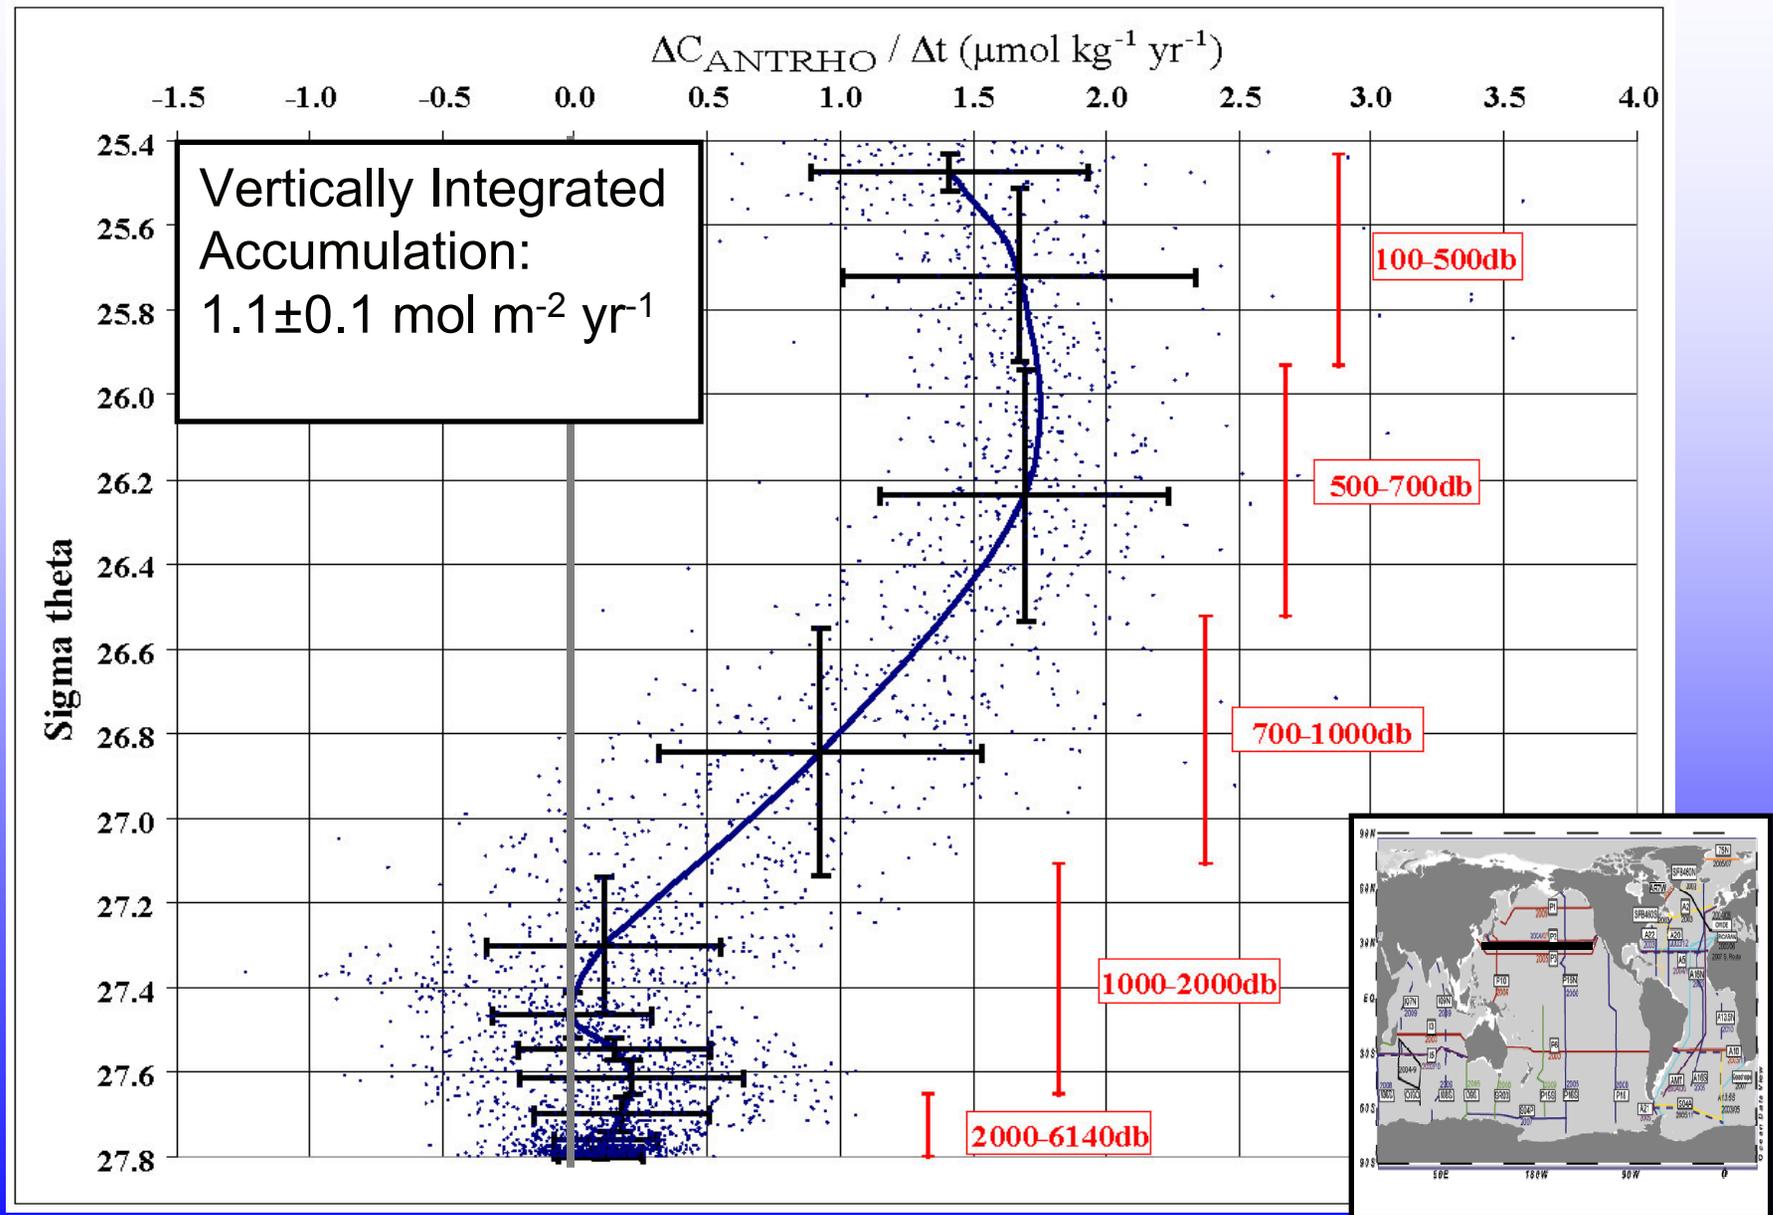

Atlantic = 1.2+/-1.4

Pacific = 0.1+/-1.6

Indian = 1.5+/-1.0

Average Global Growth Rate of Anthropogenic CO<sub>2</sub> column inventory estimates shown previously give a maximum average uptake rate of 0.4 mol m<sup>-2</sup> year<sup>-1</sup> over a global ocean area of 335.2 × 10<sup>9</sup> km<sup>2</sup>

# CO<sub>2</sub> Accumulation Rate on Isopycnal Surfaces along 30°N Based on P2 2004 - 1994 Comparison

## Use of a Multiple Linear Regression Approach to Isolate the Secular C Changes

Wallace (1995, OOSDP Report #5) first recognized that empirical relationships between carbon and other hydrographic properties could be used to isolate the  $CO_2$  uptake in the ocean.

Approach:

- 1) Fit carbon data from older cruise with properties that should not be affected by rising atmospheric  $CO_2$ ,
- 2) Use empirical fit of older cruise together with hydrographic data from new cruise to predict carbon distributions on the new cruise,
- 3) The difference between the measured carbon values on the new cruise and the predicted values is a measure of the additional carbon taken up from the atmosphere.

Friis et al. (2005, Deep Sea Res.) refined this approach with the extended MLR where both cruises are fit and take difference in fits.

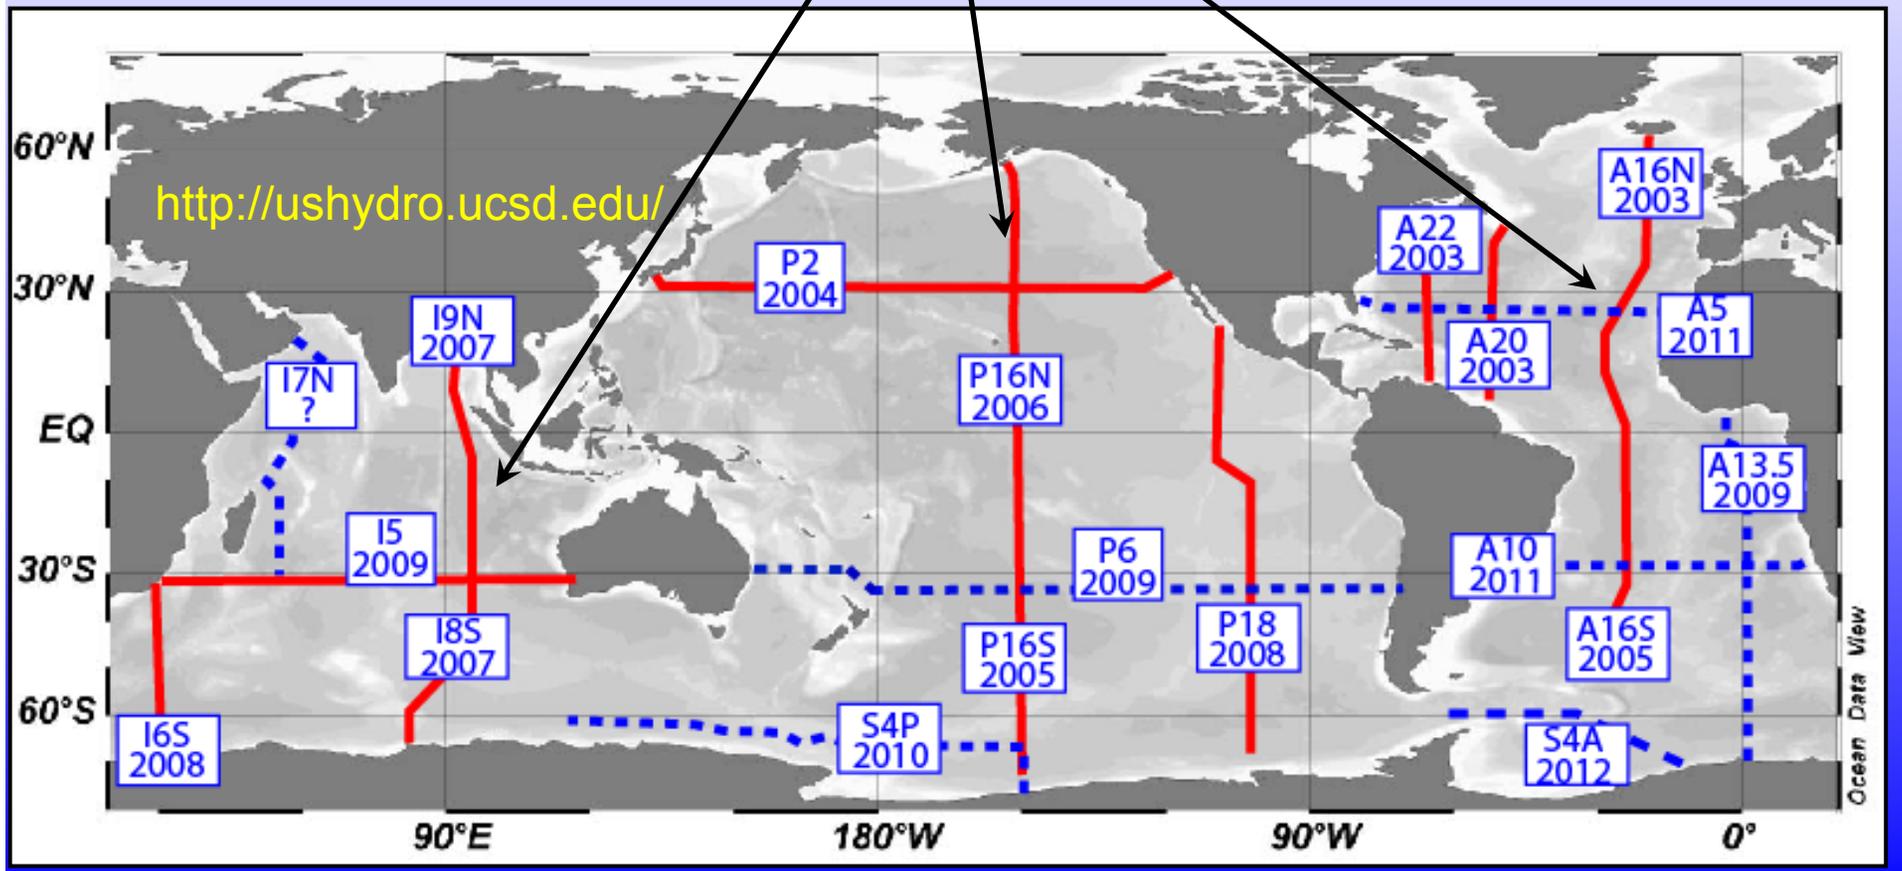

$$DIC_{(1991)} = a*\sigma_{\theta} + b*\theta + c*S + d*Si + e*P + f$$

$$DIC_{(2006)} = A*\sigma_{\theta} + B*\theta + C*S + D*Si + E*P + F$$

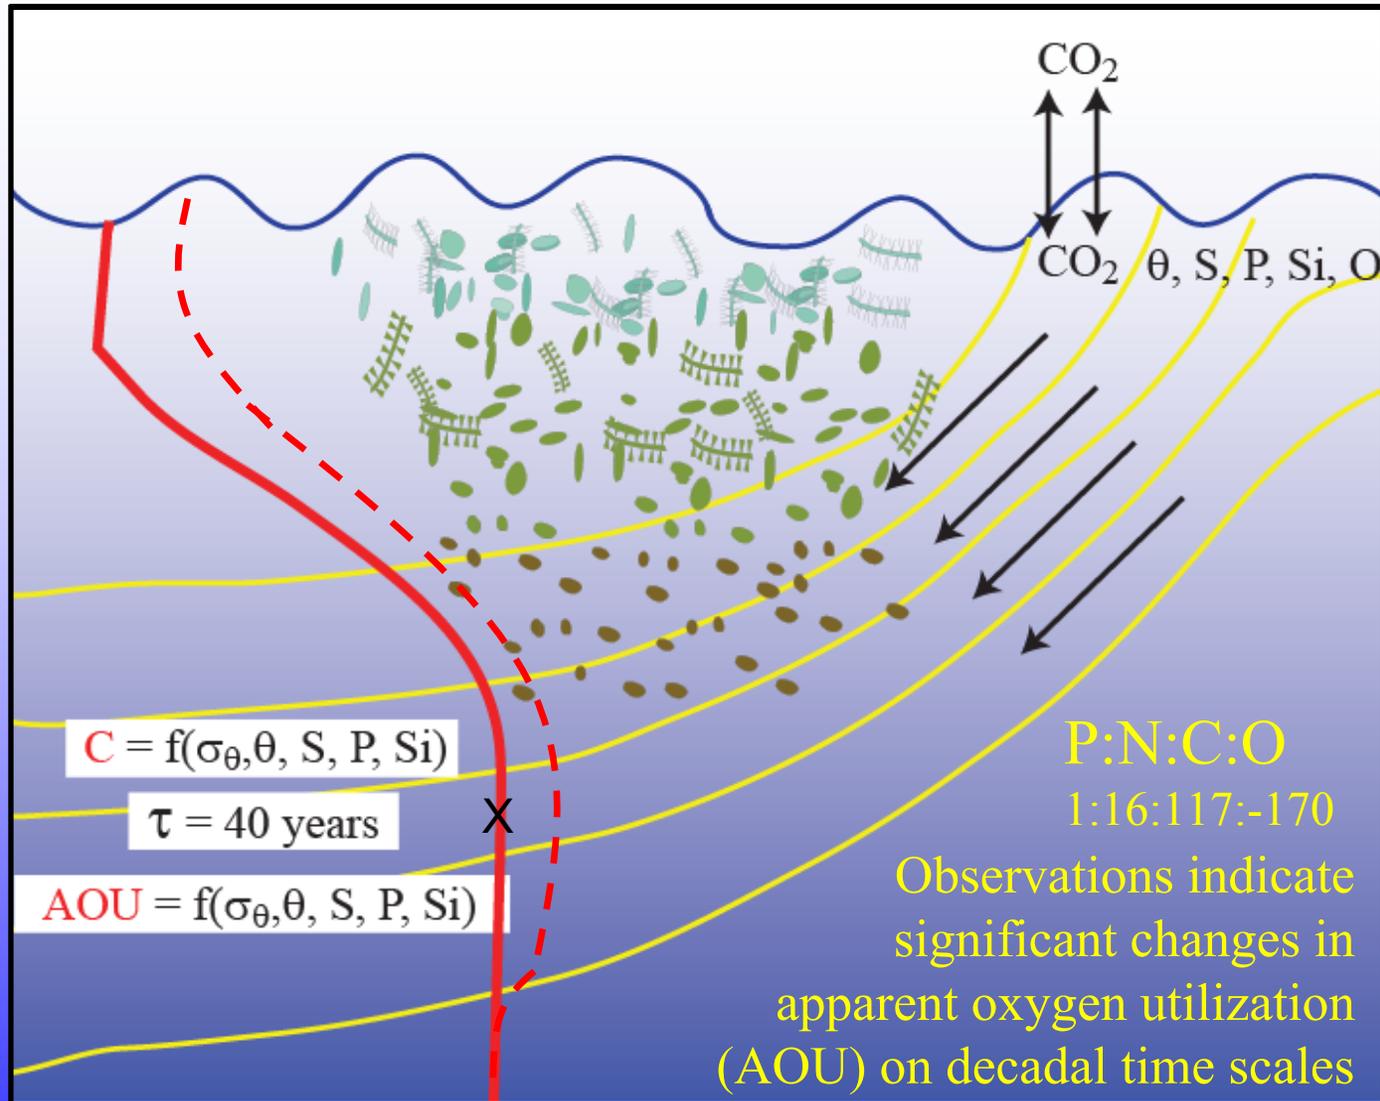

$$\Delta DIC_{(06-91)} = A-a*\sigma_{\theta} + B-b*\theta + C-c*S + D-d*Si + E-e*P + F-f$$

# What are the data telling us?

Compare representative lines from each of the basins to examine some of the issues we are facing

# How do changes in circulation affect decadal carbon storage?

By changing AOU from the DIC fit export fitting AOU independently with an empirical function we can separate the atmospheric uptake from the changes in temperature rates AOU to estimate this change

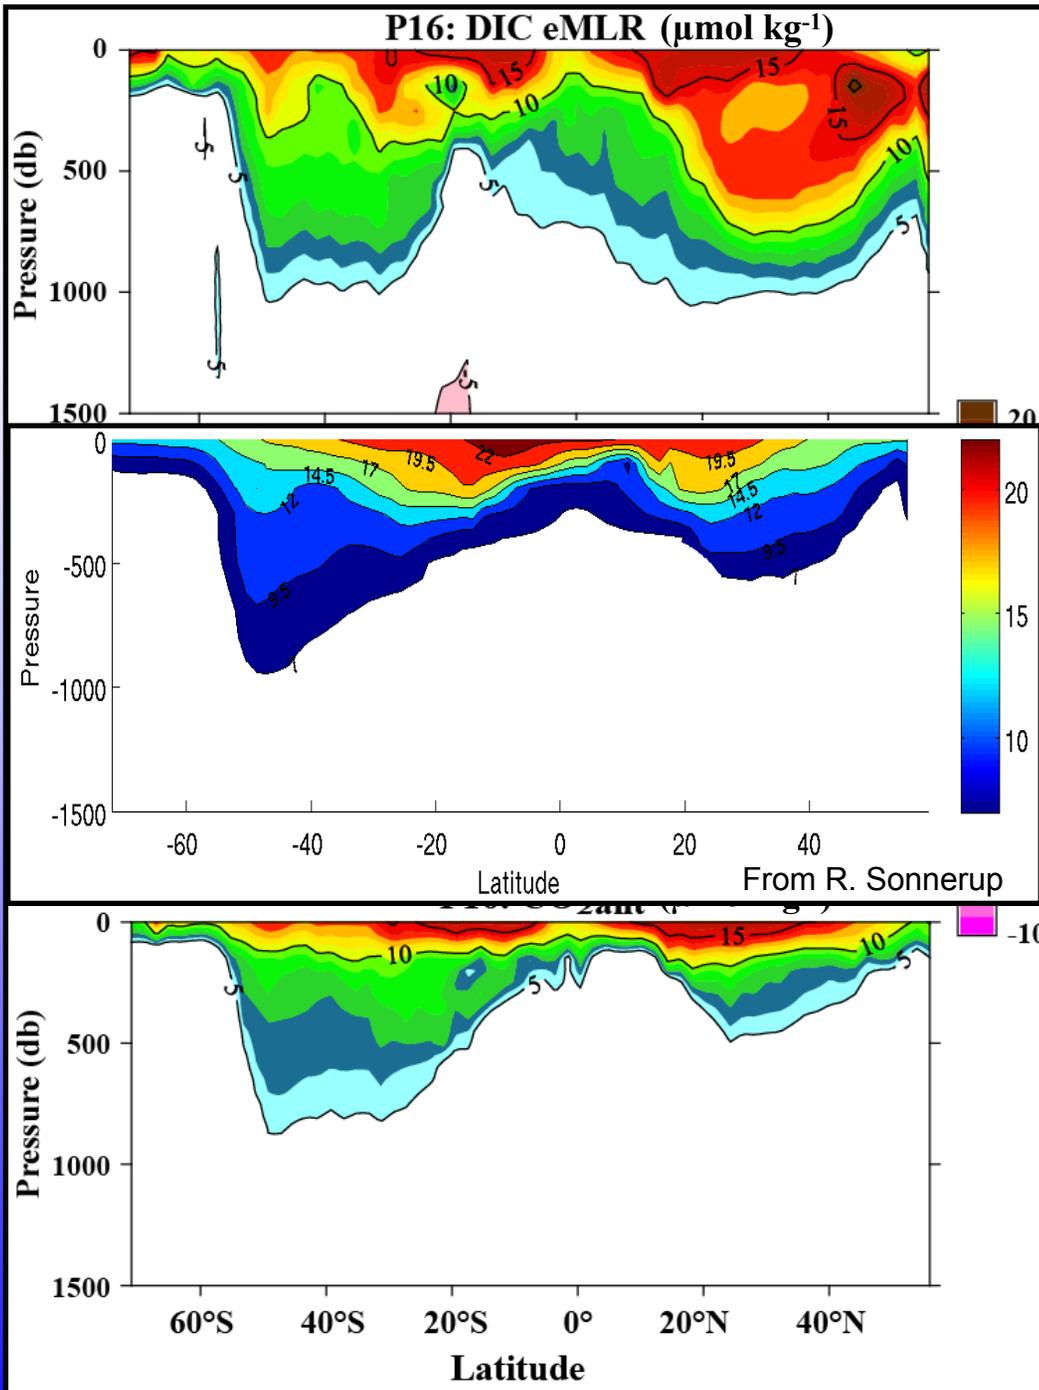

## Pacific eMLR Sections Show Much More Coherent Patterns of Change

eMLR function without AOU shows a very large DIC change in the North Pacific

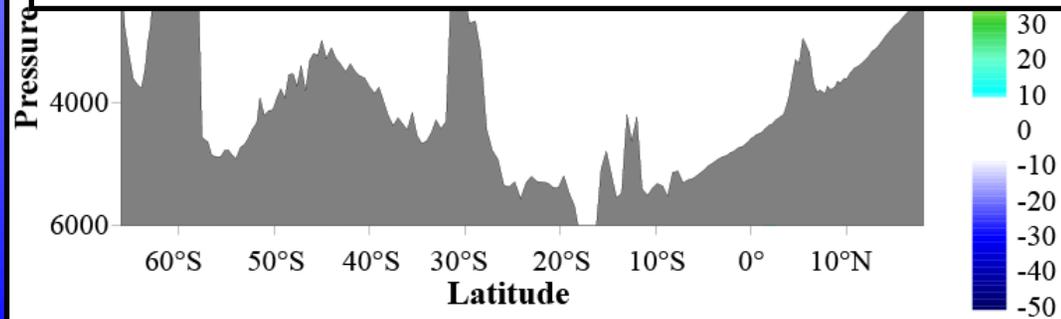

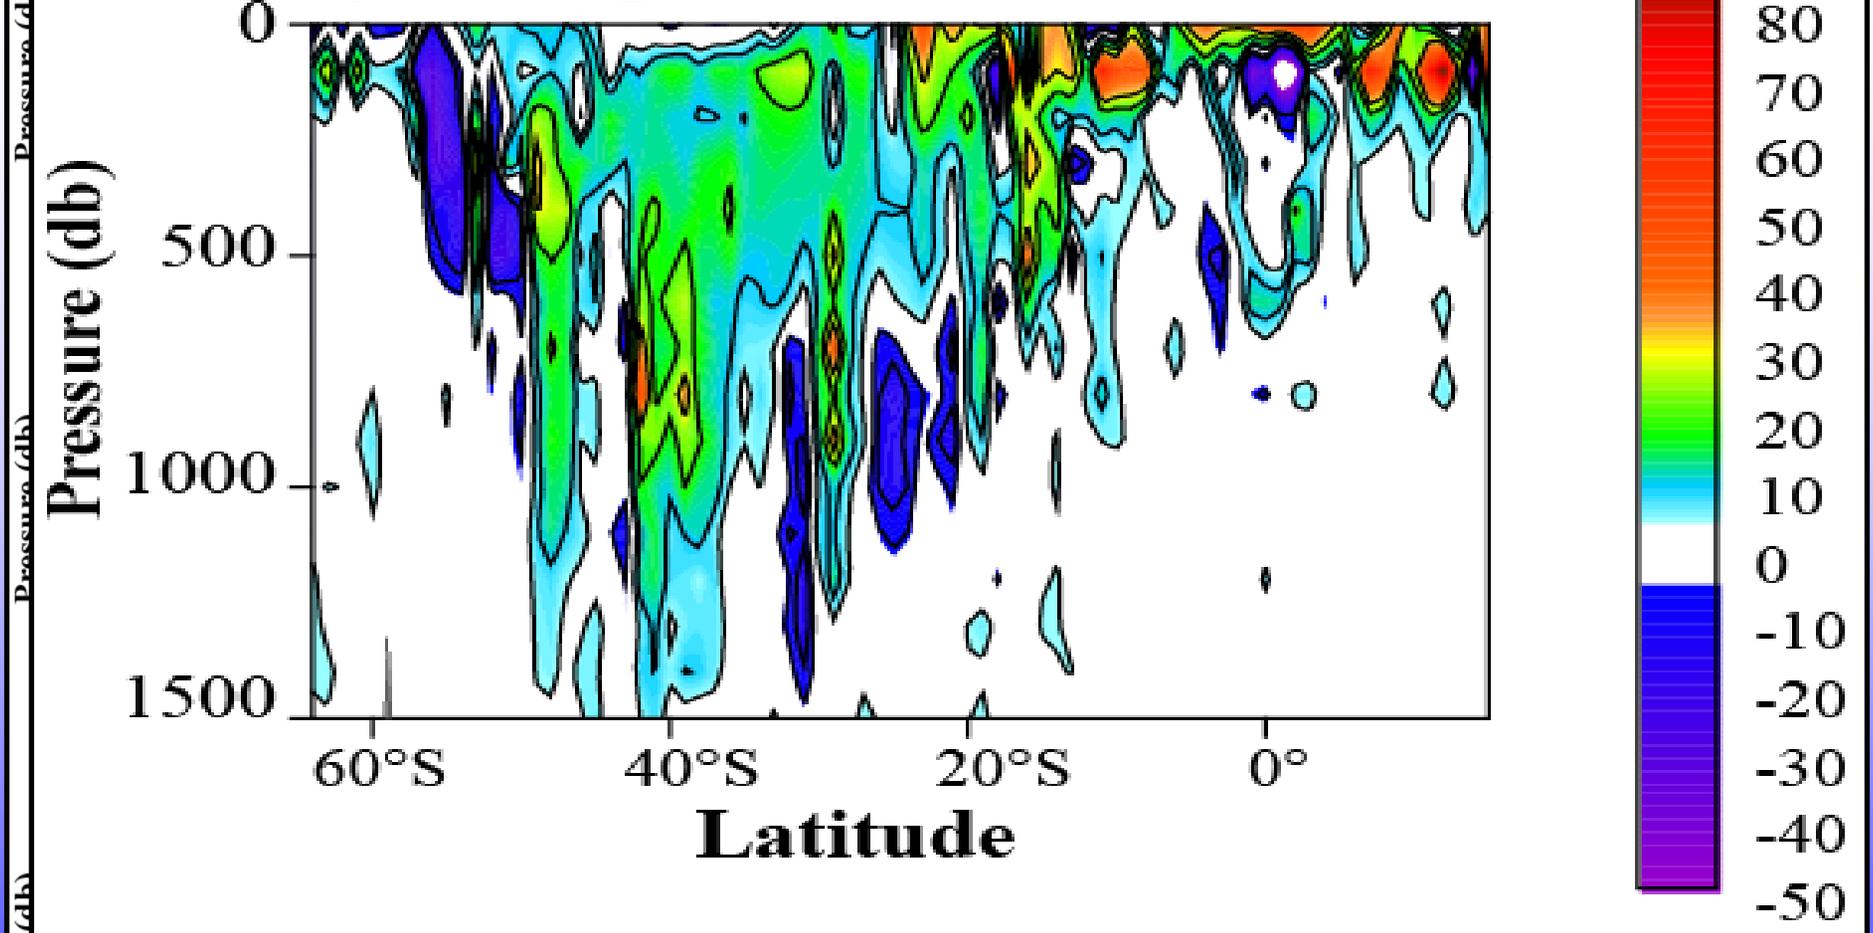

The AOU eMLR function isolates the change in apparent remineralization rate

Subtracting the AOU eMLR from the DIC eMLR gives the atmospheric CO<sub>2</sub> uptake

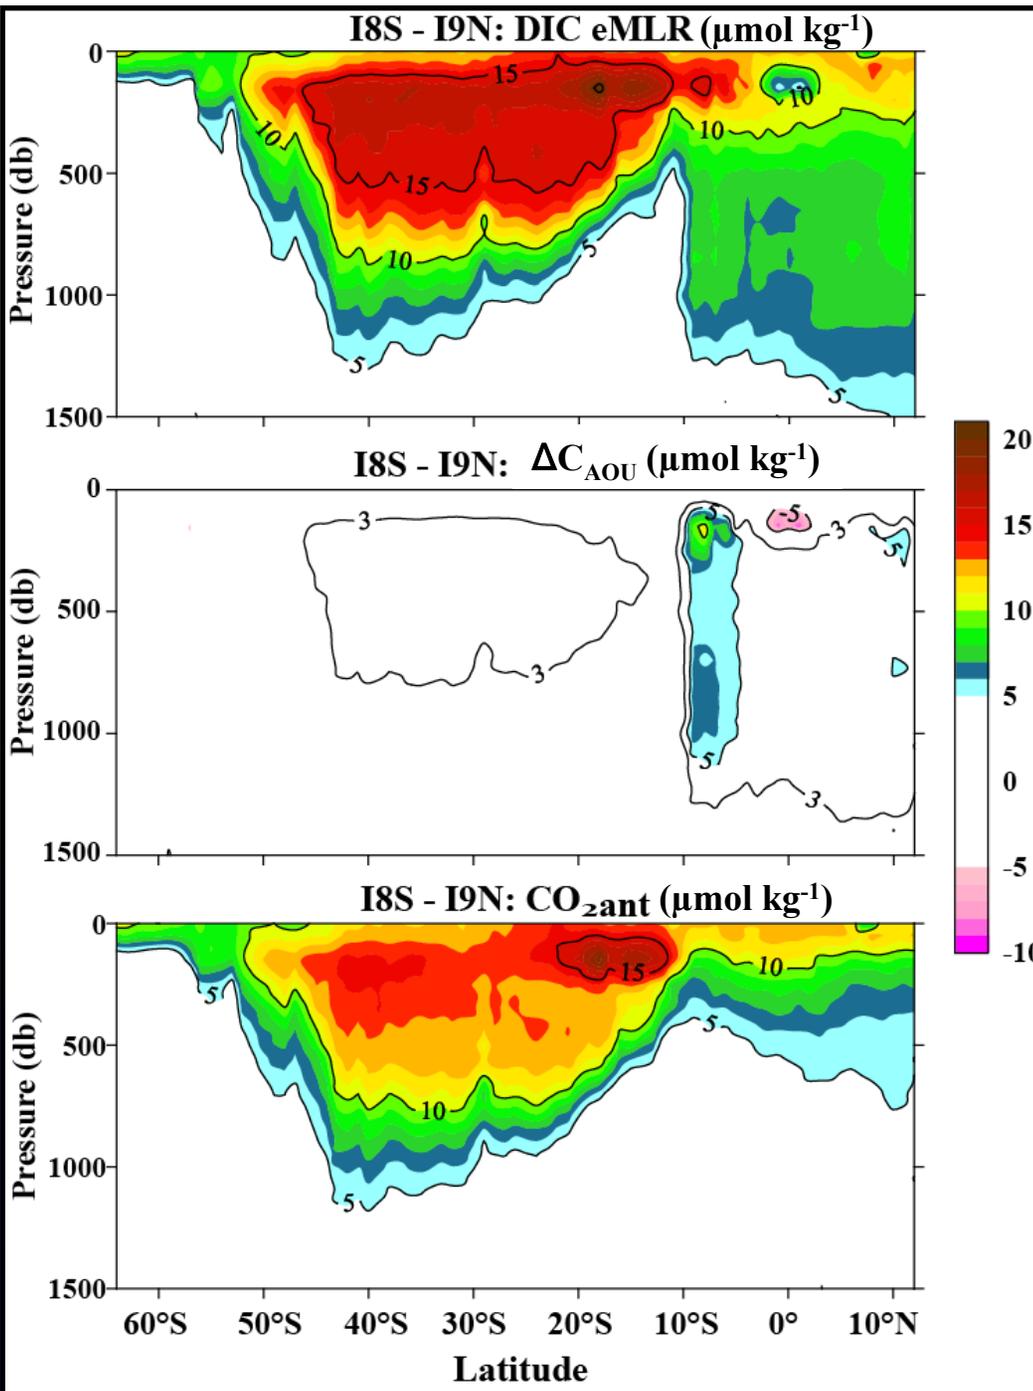

\* AOU converted to C units using Redfield Ratio

# DIC ( $\mu\text{mol kg}^{-1}$ ): I8S-I9N - 2007 - 1995

However, there are some negative values and the magnitude of the change is larger than expected.

Indian eMLR Sections Are Similar To The Pacific

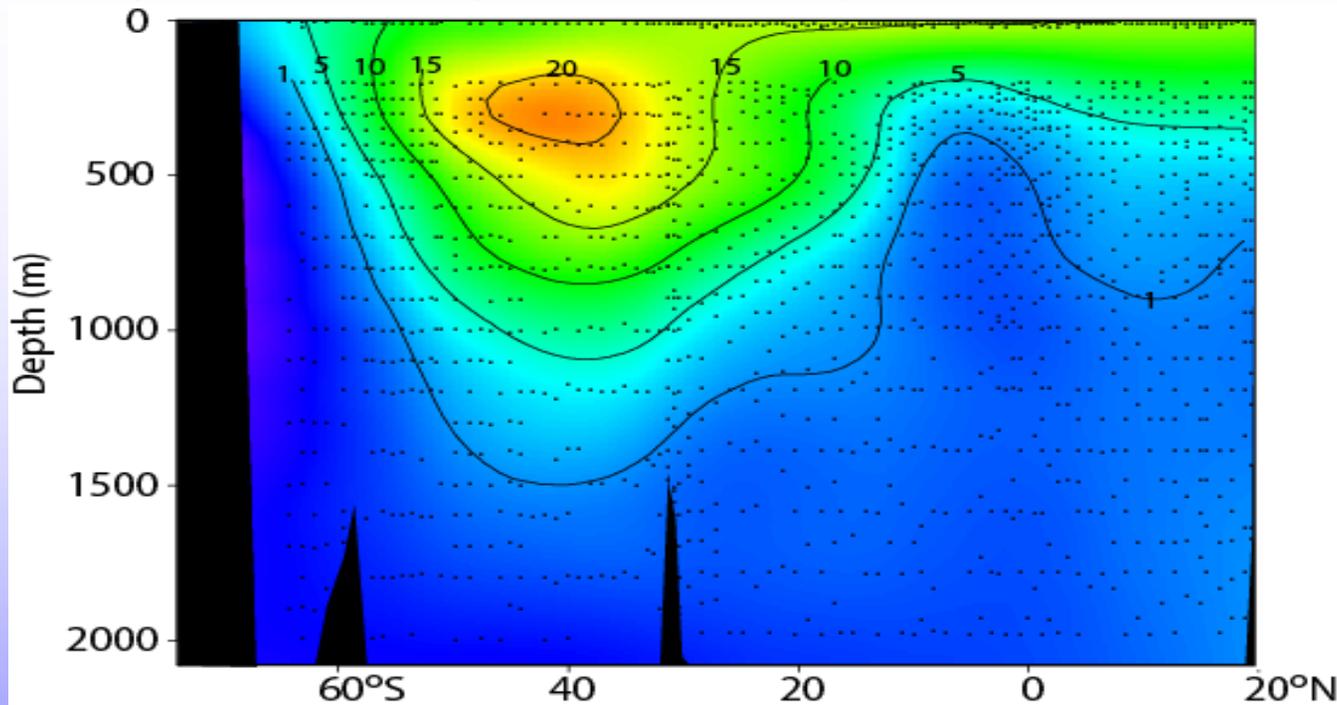

eMLR function without AOU suggests deep carbon changes north of the chemical front ( $\sim 10\text{S}$ )

The AOU eMLR function also shows modest changes

Subtracting the AOU eMLR from the DIC eMLR gives a pattern of change that is more consistent with previous estimates

Sabine et al., in prep

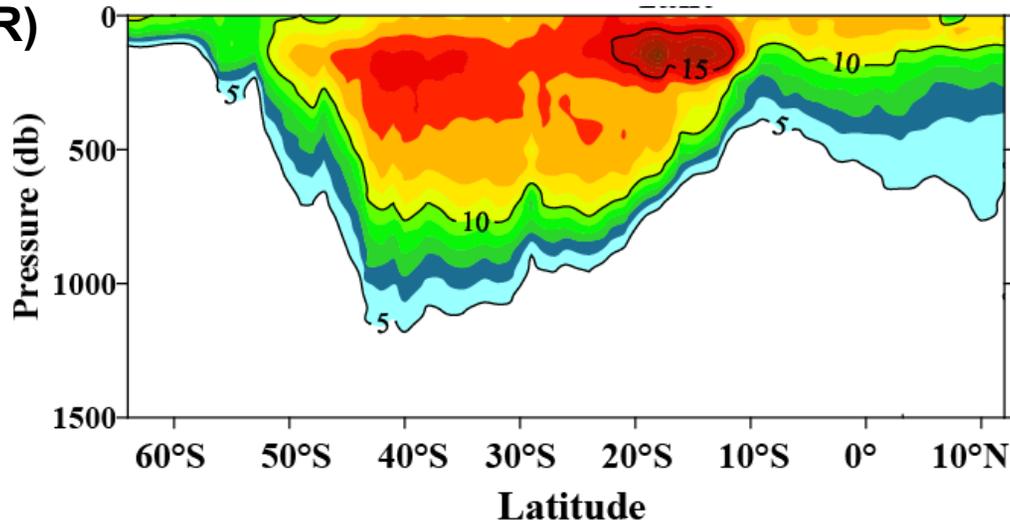

## Change in Anthropogenic C Inventory (GEOSECS to WOCE)

Average  
inventory  
Change  
1995-1977:  
 $0.45 \pm 0.3$   
 $\text{mol m}^{-2} \text{yr}^{-1}$

From Sabine et al. (1999)

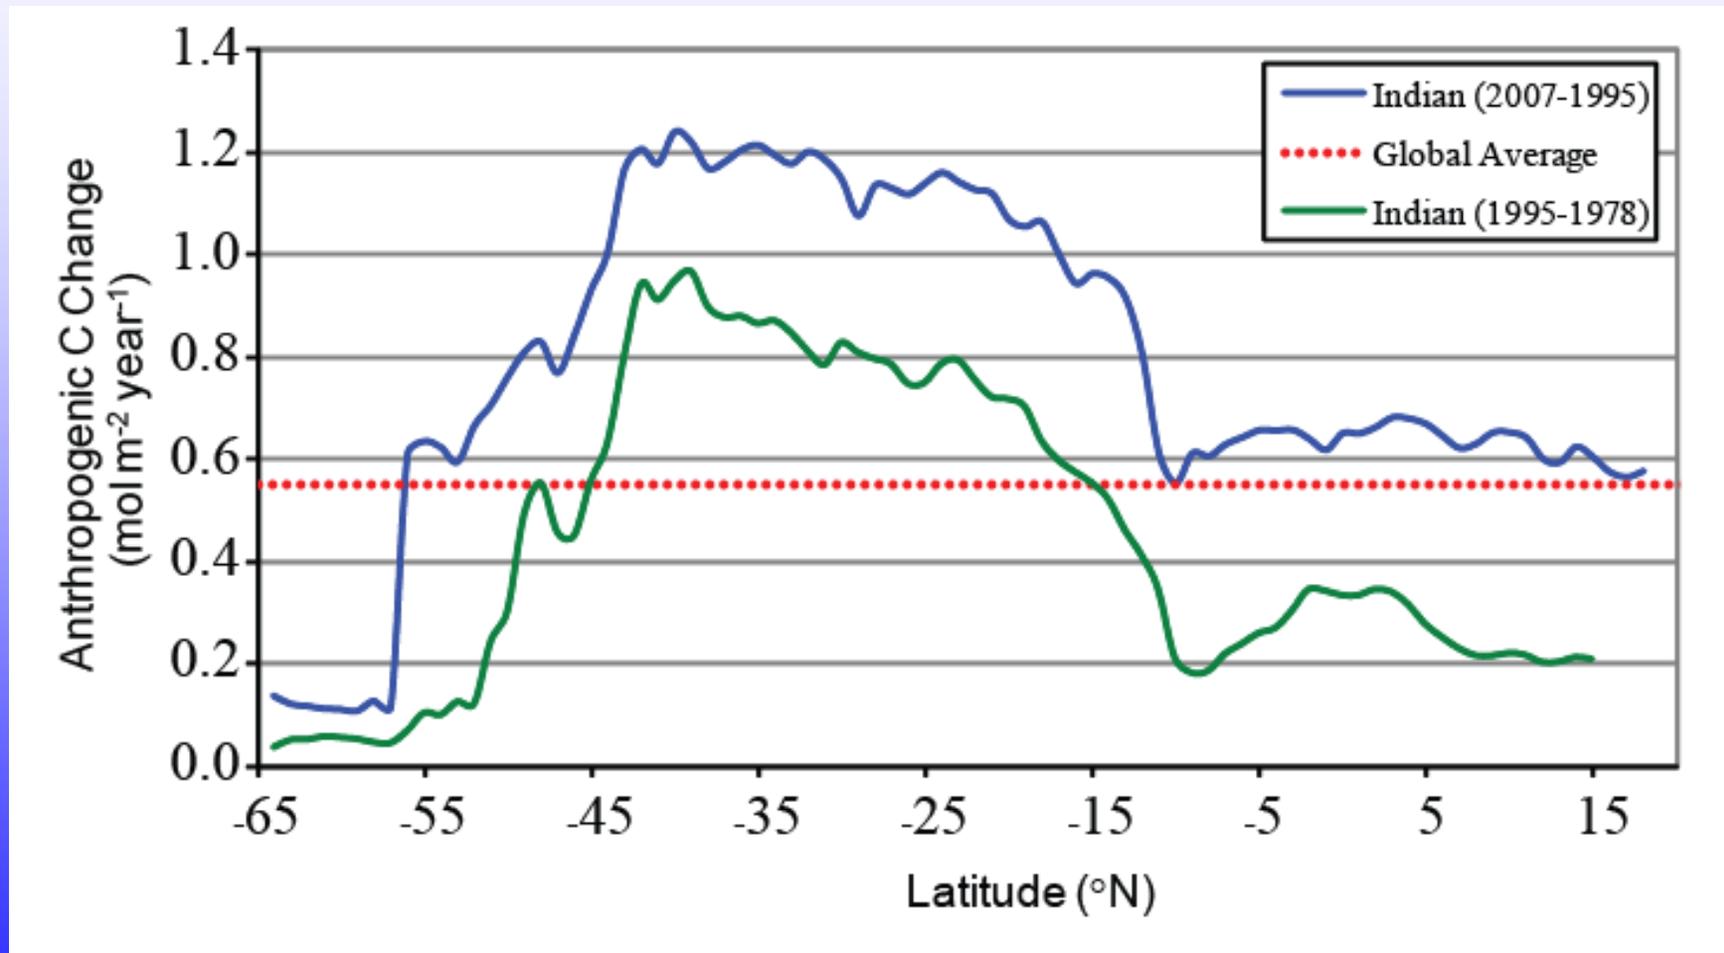

## Change in Anthropogenic C Inventory (WOCE to CLIVAR)

Average  
inventory  
Change  
2007-1995:  
 $0.79 \pm 0.3$   
 $\text{mol m}^{-2} \text{yr}^{-1}$

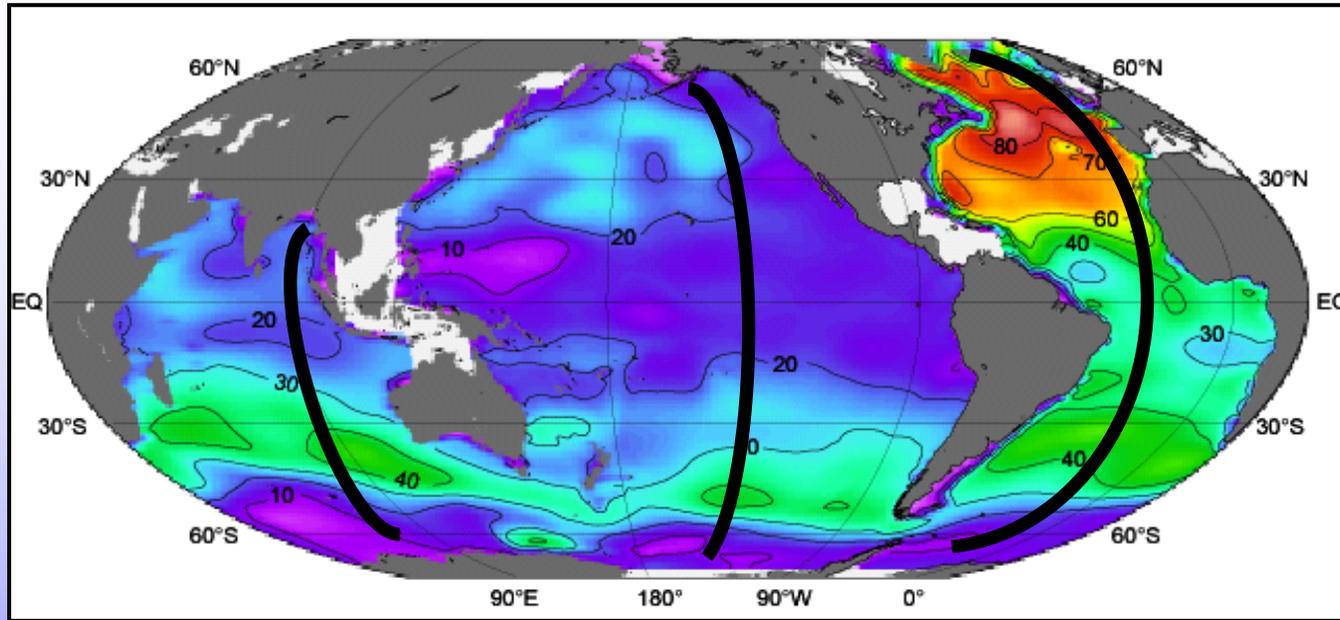

## Comparison of the Change in Anthropogenic C Inventory over two decadal periods

Anthropogenic carbon inventory increases were higher at all latitudes over the last decade than the average increases between GEOSECS and WOCE

The GEOSECS-WOCE changes were re-evaluated using the exact same techniques used for the WOCE-CLIVAR changes for these calculations.

# CLIVAR/CO<sub>2</sub> Repeat Hydrography Interim Results

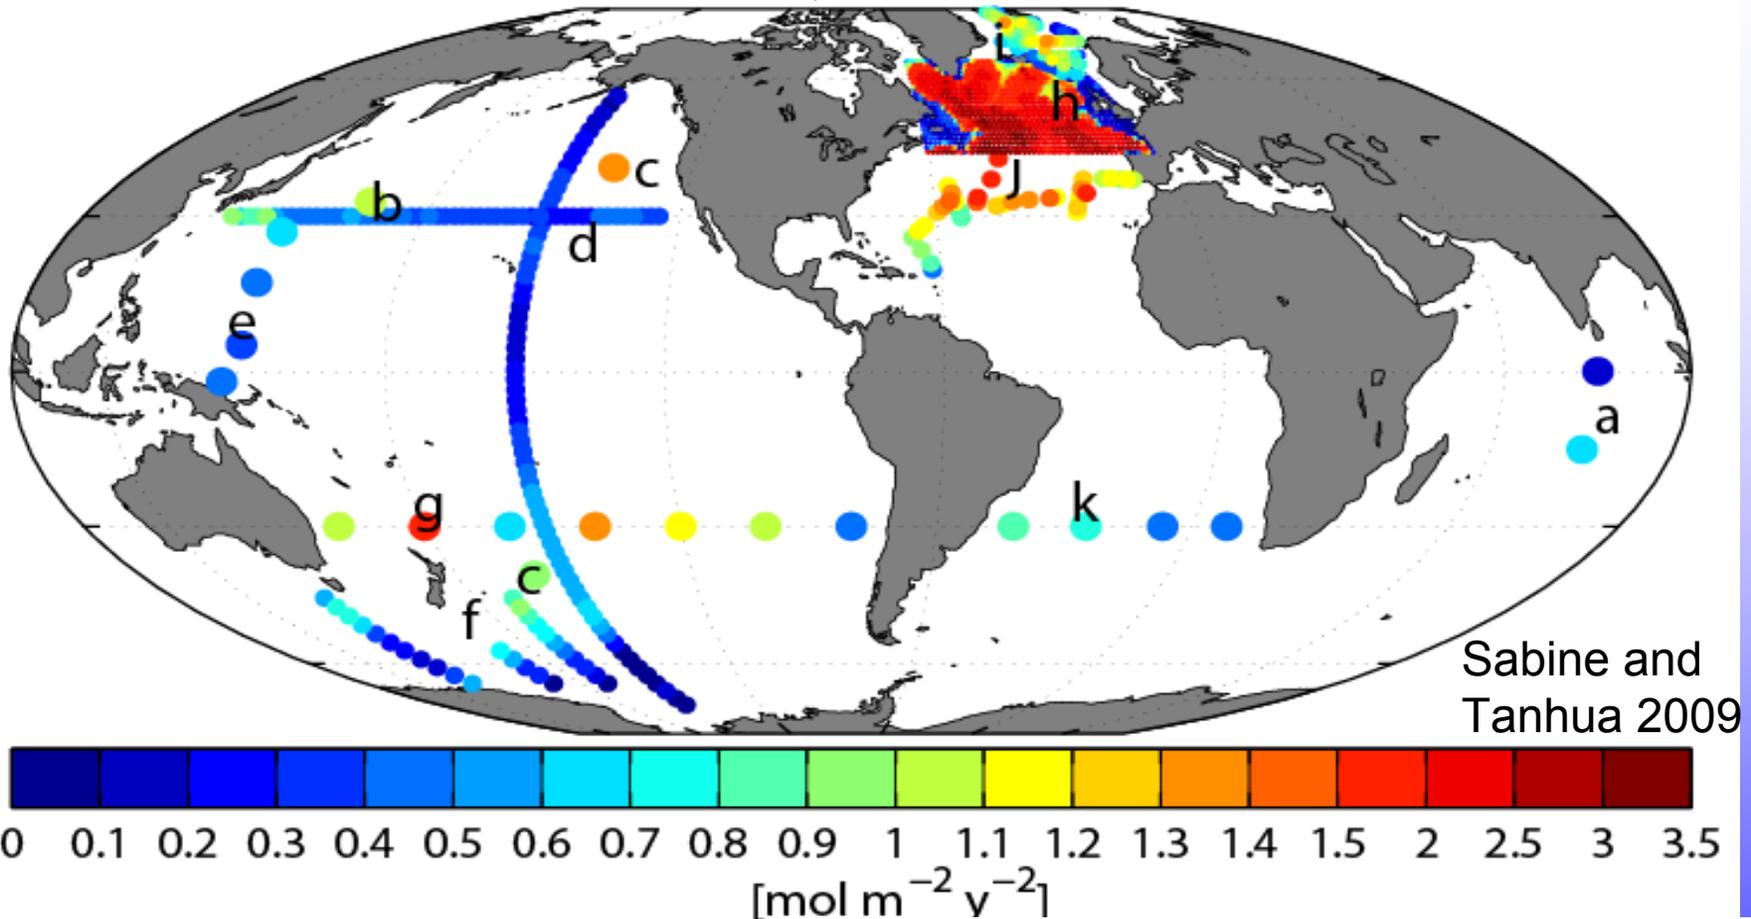

Preliminary analyses suggest that the regional anthro. C inventory changes over the last decade may have a different pattern from the long-term carbon storage distributions.

Preliminary Estimates of Decadal Ocean Anthropogenic Carbon Column Inventory Changes since WOCE (mol C m<sup>-2</sup> yr<sup>-1</sup>).

$\frac{\text{mol C}}{\text{m}^2 \text{ yr}}$	Atlantic Ocean (along 25°W)	Indian Ocean (along 90°E)	Pacific Ocean (along 152°W)
Northern Hemisphere	0.63	0.63	0.25
Southern Hemisphere	0.75	0.83	0.41

The situation is not so clear when you consider all of the different estimates published so far

#	Data from:	Time period	Method			
a	(Peng et al 1998)	1978-1995	Isopycnal, O <sub>2</sub> adjusted	e	(Murata et al 2009)	1993-2005 Isopycnal, O <sub>2</sub> adjusted
b	(Tsunogai et al 1993)	1974-1991	Column integrated change in preformed carbonate	f	(Matear & McNeil 2003)	1968-1991/1996 MLR
c	(Peng et al 2003)	1973-1991	MLR	g	(Murata et al 2007)	1992-2003 Isopycnal, O <sub>2</sub> adjusted
d	(Sabine et al 2008)	1991/2 – 2005/6 1994 - 2004	eMLR	h	(Friis et al 2005)	1981-1997/99 eMLR
				i	(Olsen et al 2006)	1981-2002/03 eMLR
				j	(Tanhua et al 2007)	1981-2004 eMLR
				k	(Murata et al 2008)	1992/93-2003 Isopycnal, O <sub>2</sub> adjusted

# So, where do we go from here?

Primary goal of the Repeat Hydrography Program is to evaluate the global decadal C inventory changes to answer the question :

Are the patterns of ocean carbon uptake changing with time...if so, how and why?

## Assets:

- Many new high quality data sets collected since WOCE
- Recent completion of the CARINA synthesis and QC
- Initialization of a Pacific synthesis effort with ~200 new cruises

## Challenges:

- Cruises are not synoptic in time (only a few cruises per year)
- Significant decadal scale variations in circulation
- Inconsistent approaches for evaluating carbon changes
- Different physical and chemical characteristics in each basin

# Conclusions

- 1) The Repeat Hydrography program is providing high quality data that is essential for detecting inventory changes
- 2) The observations reveal very large changes in carbon concentrations on decadal time scales.
- 3) Changes in apparent organic remineralization rates can have a significant impact on total carbon changes on decadal time scales and must be accounted for.
- 4) The full international repeat hydrography data set will be required to properly constrain the global decadal carbon change signal.
- 5) A coordinated approach to making decadal carbon inventory assessments will lead to more consistent results and a faster understanding of a global carbon storage.

Thank you for your time!

The R/V Thomas G. Thompson arriving in Papeete, Tahiti  
for the beginning of P16N February 2006
