Teng et al. 2014, ASLO abstract
Motivation?

To understand cell- and taxon-specific physiological responses of marine microbes and phytoplankton in the current and a changing environment;

To understand the interactions and feedbacks between plankton physiological plasticity, genetic potential and evolution and the impacts on global ocean biogeochemical cycles

M.W. Lomas, OCB Summer Meeting, July 24, 2014
Attendees:

- Students: 4
- Post-docs: 10
- Early-career: 12
- Mid-career: 14
- Late-career: 6
- BCO-DMO: 2
- Program Managers: 2

M.W. Lomas, OCB Summer Meeting, July 24, 2014
Questions we tried to address:

What are the single cell-specific and population-level traits required for parameterizing microbial “plasticity” in marine biogeochemical models of the current ocean?

Do genetic diversity, evolution and physiological plasticity have similar or different impacts on ocean biogeochemistry, particularly the production and export of particulate organic matter from the surface ocean?

What roles do taxonomic diversity and physiological plasticity play in controlling the response of microbial communities to current and future environmental stressors, for example, oxygen minimum zones, ocean acidification, ocean warming, stratification and changing nutrient concentrations or supply rates?
Preliminary summary of outcomes:

Types and scales of biodiversity

M.W. Lomas, OCB Summer Meeting, July 24, 2014
Preliminary summary of outcomes:

Linking biodiversity and measurements

**Scale**

- Population level
  - Interspecies
- Intraspecies (ecotypes)
- Phenotypic
- Biochemical (protein, metabolites)

**Methods**

- Microscopy
  - Pigments
  - Flow Cytometry
  - 16/18S rDNA, Nif
- Field manipulations
- Cell Sorted Rates
- Single cell genomics
- Nanosims
  - Raman FISH
  - SIP
  - MarFish
- Monoclonal
  - Culture Expts

- Genomics Transcriptomics
- Proteomics Protein SIP Metabolomics

M.W. Lomas, OCB Summer Meeting, July 24, 2014
Preliminary summary of outcomes:

**Scale**

- Population level
- Interspecies
- Intraspecies (ecotype to SNPs)
- Phenotypic
- Biochemical (protein, metabolites)

**Production**
- e.g., through trait selection of highest u?

**Grazing**
- e.g., through cell size changes, encounter probability

**EXPORT**
- e.g., through stoichiometric variability of exported cells, DNA fingerprints

Need methods improvements to connect plasticity with flux!
Potential products:

1) A formal workshop report to the OCB Office in the form of a white paper that communicates the vision and forward-looking priorities for this research.

2) An article for EOS highlighting the workshop conclusions and vision at a high level.

3) A detailed review publication in L&O: Review, Frontiers in Aquatic Microbiology, or similar journal.

4) Identification of key topics and possible speakers for a special session at the 2015 Aquatic Sciences meeting, potentially to include a town hall meeting to discuss the outcomes of the meeting and future research avenues.
