Unpublished data removed.
evolution in marine microbes

- Which populations are more likely to evolve?
- Why?
- Which short-term responses are good indicators of evolutionary potential (beyond genetic variation?)
- Will evolution matter?
adaptive walks

Fitness vs. Time

beneficial mutations

Env 1  Env 2

Trait 1  Trait 2

Optimum
predicting evolution

What can short-term responses tell us about the speed and outcome of evolution?
experimental evolution

standard election experiment

from Collins 2010 Evol Biol 38:3-14
but why?

standard election experiment

from Collins 2010 Evol Biol 38:3-14
softcore experimental evolution

- Uses existing evolutionary theory to understand specific biology
- Motivated by specific organisms or processes
- Looks at a specific evolutionary outcome
- Small experiments
- Low replication

hardcore experimental evolution

- Uses experimental evolution as a tool to make new theory
- Motivated by understanding evolutionary processes
- Generalizable results
- Large experiments
- High replication

Ostreococcus:
small but mighty

- Smallest (?) free-living eukaryote found yet
- Cosmopolitan – marine + brackish
- Divides ~ once per day
- Freezable (La +, usually)
- Transformable (very slow for now)
- Can grow in small cultures (2-20 ml)
- **12.6 Mb genome**, highly condensed, 20 to 21 chromosomes
- Giant virus (200 000 bp)
- Characterised ecotypes that are probably locally adapted and differ from each other.
Linking physiological and evolutionary timescales

- **Plasticity** – variation in phenotype that does not require a genetic variation.
- Can be adaptive or not.
- Lots of theory.

- Is there variation in plastic responses within species?
- Does variation in plasticity explain changes in relative fitness?
- Does variation in initial plasticity explain variation in microevolutionary outcomes?
phenotypic plasticity and evolution

- Plasticity can facilitate genetic adaptation/population persistence by allowing population size to remain high (Chevin et al. 2010)
- Plasticity can impede genetic adaptation by attenuating selection pressure
- Plasticity can facilitate phenotypic adaptation/evolvability by giving combinations of traits directions to vary in (Draghi and Whitlock 2012)
plastic fantastic

O. tauri

E. Schaum
collecting ecotypes
and now, the obligatory contentious definition

Fitness response = \frac{\text{Growth rate at high CO}_2 - \text{growth rate at low CO}_2}{\text{growth rate at low CO}_2}

Plastic response = \frac{\text{Photosynthesis (PS) rate at high CO}_2 - \text{PS at low CO}_2}{\text{PS at low CO}_2}
fitness and plastic responses

Figure 1: 

Schaum et al. 2013
• There is as much variation in plasticity between ecotypes of a single species as between functional groups

<table>
<thead>
<tr>
<th>Functional group</th>
<th>Mean fold change in growth</th>
<th>Within group variance in growth response</th>
<th>Between group variance in growth response</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cyanobacteria</td>
<td>1.5</td>
<td>0.04</td>
<td>0.1</td>
</tr>
<tr>
<td>Diatoms</td>
<td>1.1</td>
<td>0.03</td>
<td>0.1</td>
</tr>
<tr>
<td>Coccolithophores</td>
<td>0.91</td>
<td>0.04</td>
<td>0.1</td>
</tr>
<tr>
<td>Green algae</td>
<td>1.5</td>
<td><strong>0.36</strong></td>
<td>0.1</td>
</tr>
</tbody>
</table>
variation in plasticity there is

- There is lots of variation in the magnitude of plastic and fitness in response to changes in CO$_2$ in *Ostreococcus*
- The variation correlated with location
- Larger, faster growing cells with high C:N.
what does plasticity tell us about evolution?

Approx 400 asexual generations, for 16 ecotypes
selection regimes

- Selection for plasticity + high CO₂
- Selection at high CO₂ only
- Selection for plasticity only
- Control
plasticity facilitates evolution

- Plasticity can evolve in fluctuating environments
- Populations with higher initial plasticity evolve more, and this effect is stronger in fluctuating environments
Plasticity evolves or is maintained in fluctuating environments.

Plasticity predicts the magnitude, but not the direction, of evolution.

All else equal, plastic populations evolve more.

High CO$_2$ increases fitness in O.tauri initially, but becomes stressful over hundreds of generations.
small but mighty

- Theory – experiments in the lab – experiments in the field – various omics.
• short-term responses that don’t involve any genetic change can (and do) affect evolution that uses de novo mutation
• we have a lot of theory, and almost no tests of it
• Expt evol. with reasonably cooperative marine microbes lets us go from theory – lab expts – field expts. Yay!
